Version:	Information in this guide refers to SecureStack A2 firmware version 1.03.xx.
-----------------	--

Enterasys Networks, Inc. Firmware License Agreement

BEFORE OPENING OR UTILIZING THE ENCLOSED PRODUCT, CAREFULLY READ THIS LICENSE AGREEMENT.

This document is an agreement (“Agreement”) between the end user (“You”) and Enterasys Networks, Inc. on behalf of itself and its Affiliates (as hereinafter defined) (“Enterasys”) that sets forth Your rights and obligations with respect to the Enterasys software program/firmware installed on the Enterasys product (including any accompanying documentation, hardware or media) (“Program”) in the package and prevails over any additional, conflicting or inconsistent terms and conditions appearing on any purchase order or other document submitted by You. “Affiliate” means any person, partnership, corporation, limited liability company, or other form of enterprise that directly or indirectly through one or more intermediaries, controls, or is controlled by, or is under common control with the party specified. This Agreement constitutes the entire understanding between the parties, and supersedes all prior discussions, representations, understandings or agreements, whether oral or in writing, between the parties with respect to the subject matter of this Agreement. The Program may be contained in firmware, chips or other media.

BY INSTALLING OR OTHERWISE USING THE PROGRAM, YOU REPRESENT THAT YOU ARE AUTHORIZED TO ACCEPT THESE TERMS ON BEHALF OF THE END USER (IF THE END USER IS AN ENTITY ON WHOSE BEHALF YOU ARE AUTHORIZED TO ACT, “YOU” AND “YOUR” SHALL BE DEEMED TO REFER TO SUCH ENTITY) AND THAT YOU AGREE THAT YOU ARE BOUND BY THE TERMS OF THIS AGREEMENT, WHICH INCLUDES, AMONG OTHER PROVISIONS, THE LICENSE, THE DISCLAIMER OF WARRANTY AND THE LIMITATION OF LIABILITY. IF YOU DO NOT AGREE TO THE TERMS OF THIS AGREEMENT OR ARE NOT AUTHORIZED TO ENTER INTO THIS AGREEMENT, ENTERASYS IS UNWILLING TO LICENSE THE PROGRAM TO YOU AND YOU AGREE TO RETURN THE UNOPENED PRODUCT TO ENTERASYS OR YOUR DEALER, IF ANY, WITHIN TEN (10) DAYS FOLLOWING THE DATE OF RECEIPT FOR A FULL REFUND.

IF YOU HAVE ANY QUESTIONS ABOUT THIS AGREEMENT, CONTACT ENTERASYS NETWORKS, LEGAL DEPARTMENT AT (978) 684-1000.

You and Enterasys agree as follows:

- 1. LICENSE.** You have the non-exclusive and non-transferable right to use only the one (1) copy of the Program provided in this package subject to the terms and conditions of this Agreement.
- 2. RESTRICTIONS.** Except as otherwise authorized in writing by Enterasys, You may not, nor may You permit any third party to:
 - (i) Reverse engineer, decompile, disassemble or modify the Program, in whole or in part, including for reasons of error correction or interoperability, except to the extent expressly permitted by applicable law and to the extent the parties shall not be permitted by that applicable law, such rights are expressly excluded. Information necessary to achieve interoperability or correct errors is available from Enterasys upon request and upon payment of Enterasys’ applicable fee.
 - (ii) Incorporate the Program, in whole or in part, in any other product or create derivative works based on the Program, in whole or in part.
 - (iii) Publish, disclose, copy, reproduce or transmit the Program, in whole or in part.
 - (iv) Assign, sell, license, sublicense, rent, lease, encumber by way of security interest, pledge or otherwise transfer the Program, in whole or in part.
 - (v) Remove any copyright, trademark, proprietary rights, disclaimer or warning notice included on or embedded in any part of the Program.

3. APPLICABLE LAW. This Agreement shall be interpreted and governed under the laws and in the state and federal courts of the Commonwealth of Massachusetts without regard to its conflicts of laws provisions. You accept the personal jurisdiction and venue of the Commonwealth of Massachusetts courts. None of the 1980 United Nations Convention on Contracts for the International Sale of Goods, the United Nations Convention on the Limitation Period in the International Sale of Goods, and the Uniform Computer Information Transactions Act shall apply to this Agreement.

4. EXPORT RESTRICTIONS. You understand that Enterasys and its Affiliates are subject to regulation by agencies of the U.S. Government, including the U.S. Department of Commerce, which prohibit export or diversion of certain technical products to certain countries, unless a license to export the Program is obtained from the U.S. Government or an exception from obtaining such license may be relied upon by the exporting party.

If the Program is exported from the United States pursuant to the License Exception CIV under the U.S. Export Administration Regulations, You agree that You are a civil end user of the Program and agree that You will use the Program for civil end uses only and not for military purposes.

If the Program is exported from the United States pursuant to the License Exception TSR under the U.S. Export Administration Regulations, in addition to the restriction on transfer set forth in Sections 1 or 2 of this Agreement, You agree not to (i) reexport or release the Program, the source code for the Program or technology to a national of a country in Country Groups D:1 or E:2 (Albania, Armenia, Azerbaijan, Belarus, Bulgaria, Cambodia, Cuba, Estonia, Georgia, Iraq, Kazakhstan, Kyrgyzstan, Laos, Latvia, Libya, Lithuania, Moldova, North Korea, the People's Republic of China, Romania, Russia, Rwanda, Tajikistan, Turkmenistan, Ukraine, Uzbekistan, Vietnam, or such other countries as may be designated by the United States Government), (ii) export to Country Groups D:1 or E:2 (as defined herein) the direct product of the Program or the technology, if such foreign produced direct product is subject to national security controls as identified on the U.S. Commerce Control List, or (iii) if the direct product of the technology is a complete plant or any major component of a plant, export to Country Groups D:1 or E:2 the direct product of the plant or a major component thereof, if such foreign produced direct product is subject to national security controls as identified on the U.S. Commerce Control List or is subject to State Department controls under the U.S. Munitions List.

5. UNITED STATES GOVERNMENT RESTRICTED RIGHTS. The enclosed Program (i) was developed solely at private expense; (ii) contains "restricted computer software" submitted with restricted rights in accordance with section 52.227-19 (a) through (d) of the Commercial Computer Software-Restricted Rights Clause and its successors, and (iii) in all respects is proprietary data belonging to Enterasys and/or its suppliers. For Department of Defense units, the Program is considered commercial computer software in accordance with DFARS section 227.7202-3 and its successors, and use, duplication, or disclosure by the Government is subject to restrictions set forth herein.

6. DISCLAIMER OF WARRANTY. EXCEPT FOR THOSE WARRANTIES EXPRESSLY PROVIDED TO YOU IN WRITING BY ENTERASYS, ENTERASYS DISCLAIMS ALL WARRANTIES, EITHER EXPRESS OR IMPLIED, INCLUDING BUT NOT LIMITED TO IMPLIED WARRANTIES OF MERCHANTABILITY, SATISFACTORY QUALITY, FITNESS FOR A PARTICULAR PURPOSE, TITLE AND NON- INFRINGEMENT WITH RESPECT TO THE PROGRAM. IF IMPLIED WARRANTIES MAY NOT BE DISCLAIMED BY APPLICABLE LAW, THEN ANY IMPLIED WARRANTIES ARE LIMITED IN DURATION TO THIRTY (30) DAYS AFTER DELIVERY OF THE PROGRAM TO YOU.

7. LIMITATION OF LIABILITY. IN NO EVENT SHALL ENTERASYS OR ITS SUPPLIERS BE LIABLE FOR ANY DAMAGES WHATSOEVER (INCLUDING, WITHOUT LIMITATION, DAMAGES FOR LOSS OF BUSINESS, PROFITS, BUSINESS INTERRUPTION, LOSS OF BUSINESS INFORMATION, SPECIAL, INCIDENTAL, CONSEQUENTIAL, OR RELIANCE DAMAGES, OR OTHER LOSS) ARISING OUT OF THE USE OR INABILITY TO USE THE PROGRAM, EVEN IF ENTERASYS HAS BEEN ADVISED OF THE POSSIBILITY OF SUCH DAMAGES. THIS FOREGOING LIMITATION SHALL APPLY REGARDLESS OF THE CAUSE OF ACTION UNDER WHICH DAMAGES ARE SOUGHT.

THE CUMULATIVE LIABILITY OF ENTERASYS TO YOU FOR ALL CLAIMS RELATING TO THE PROGRAM, IN CONTRACT, TORT OR OTHERWISE, SHALL NOT EXCEED THE TOTAL AMOUNT OF FEES PAID TO ENTERASYS BY YOU FOR THE RIGHTS GRANTED HEREIN.

8. AUDIT RIGHTS. You hereby acknowledge that the intellectual property rights associated with the Program are of critical value to Enterasys and, accordingly, You hereby agree to maintain complete books, records and accounts showing (i) license fees due and paid, and (ii) the use, copying and deployment of the Program. You also grant to Enterasys and its authorized representatives, upon reasonable notice, the right to audit and examine during Your normal business hours, Your books, records, accounts and hardware devices upon which the Program may be deployed to verify compliance with this Agreement, including the verification of the license fees due and paid Enterasys and the use, copying and deployment of the Program. Enterasys' right of examination shall be exercised reasonably, in good faith and in a manner calculated to not unreasonably interfere with Your business. In the event such audit discovers non-compliance with this Agreement, including copies of the Program made, used or deployed in breach of this Agreement, You shall promptly pay to Enterasys the appropriate license fees. Enterasys reserves the right, to be exercised in its sole discretion and without prior notice, to terminate this license, effective immediately, for failure to comply with this Agreement. Upon any such termination, You shall immediately cease all use of the Program and shall return to Enterasys the Program and all copies of the Program.

9. OWNERSHIP. This is a license agreement and not an agreement for sale. You acknowledge and agree that the Program constitutes trade secrets and/or copyrighted material of Enterasys and/or its suppliers. You agree to implement reasonable security measures to protect such trade secrets and copyrighted material. All right, title and interest in and to the Program shall remain with Enterasys and/or its suppliers. All rights not specifically granted to You shall be reserved to Enterasys.

10. ENFORCEMENT. You acknowledge and agree that any breach of Sections 2, 4, or 9 of this Agreement by You may cause Enterasys irreparable damage for which recovery of money damages would be inadequate, and that Enterasys may be entitled to seek timely injunctive relief to protect Enterasys' rights under this Agreement in addition to any and all remedies available at law.

11. ASSIGNMENT. You may not assign, transfer or sublicense this Agreement or any of Your rights or obligations under this Agreement, except that You may assign this Agreement to any person or entity which acquires substantially all of Your stock or assets. Enterasys may assign this Agreement in its sole discretion. This Agreement shall be binding upon and inure to the benefit of the parties, their legal representatives, permitted transferees, successors and assigns as permitted by this Agreement. Any attempted assignment, transfer or sublicense in violation of the terms of this Agreement shall be void and a breach of this Agreement.

12. WAIVER. A waiver by Enterasys of a breach of any of the terms and conditions of this Agreement must be in writing and will not be construed as a waiver of any subsequent breach of such term or condition. Enterasys' failure to enforce a term upon Your breach of such term shall not be construed as a waiver of Your breach or prevent enforcement on any other occasion.

13. SEVERABILITY. In the event any provision of this Agreement is found to be invalid, illegal or unenforceable, the validity, legality and enforceability of any of the remaining provisions shall not in any way be affected or impaired thereby, and that provision shall be reformed, construed and enforced to the maximum extent permissible. Any such invalidity, illegality or unenforceability in any jurisdiction shall not invalidate or render illegal or unenforceable such provision in any other jurisdiction.

14. TERMINATION. Enterasys may terminate this Agreement immediately upon Your breach of any of the terms and conditions of this Agreement. Upon any such termination, You shall immediately cease all use of the Program and shall return to Enterasys the Program and all copies of the Program.

About This Guide

Welcome to the Enterasys Networks *SecureStack A2 Configuration Guide*. This manual explains how to access the device's Command Line Interface (CLI) and how to use it to configure SecureStack A2 switch devices.

Important Notice

Depending on the firmware version used in your device, some features described in this document may not be supported. Refer to the Release Notes shipped with your device to determine which features are supported.

USING THIS GUIDE

A general working knowledge of basic network operations and an understanding of CLI management applications is helpful before configuring the SecureStack A2 device.

This manual describes how to do the following:

- Access the SecureStack A2 CLI.
- Use CLI commands to perform network management and device configuration operations.
- Establish and manage Virtual Local Area Networks (VLANs).
- Manage static and dynamically-assigned user policies.
- Establish and manage priority classification.
- Configure security protocols, including 802.1X and RADIUS, SSHv2 and MAC locking.

STRUCTURE OF THIS GUIDE

The guide is organized as follows:

Chapter 1, Introduction, provides an overview of the tasks that can be accomplished using the CLI interface, an overview of local management requirements, and information about obtaining technical support.

Chapter 2, Startup and General Configuration, provides an overview of the device's factory default settings and describes how to start the CLI interface, how to set basic system properties, how to download a firmware image, how to configure WebView and Telnet, how to manage configuration files, how to set the login password, and how to exit the CLI.

Chapter 3, Port Configuration, describes how to review and configure console port settings, and how to enable or disable switch ports and configure switch port settings, including port speed, duplex mode, auto-negotiation, flow control, port mirroring, link aggregation and broadcast suppression.

Chapter 4, SNMP Configuration, describes how to configure SNMP users and user groups, access rights, target addresses, and notification parameters.

Chapter 5, Spanning Tree Configuration, describes how to review and set Spanning Tree bridge parameters for the device, including bridge priority, hello time, maximum aging time and forward delay; and how to review and set Spanning Tree port parameters, including port priority and path costs.

Chapter 6, 802.1Q VLAN Configuration, describes how to create static VLANs, select the mode of operation for each port, establish VLAN forwarding (egress) lists, route frames according to VLAN ID, display the current ports and port types associated with a VLAN and protocol, create a secure management VLAN, and configure ports on the device as GVRP-aware ports.

Chapter 7, Differentiated Services Configuration, describes how to review and configure Diffserv settings.

Chapter 8, Port Priority and Rate Limiting Configuration, describes how to set the transmit priority of each port, display the current traffic class mapping-to-priority of each port, set ports to either transmit frames according to selected priority transmit queues or percentage of port transmission capacity for each queue, and configure a rate limit for a given port and list of priorities.

Chapter 9, IGMP Configuration, describes how to configure Internet Group Management Protocol (IGMP) settings for multicast filtering .

Chapter 10, Security Configuration, describes how to configure 802.1X authentication using EAPOL, how to configure a RADIUS server, Secure Shell server and MAC locking.

Chapter 11, **Logging and Network Management**, describes how to configure Syslog, how to manage general switch settings, how to monitor network events and status, how to manage network addresses and routes, and how to configure SNTP and node aliases.

Chapter 12, **Configuring RMON**, describes how to use RMON (Remote Network Monitoring), which provides comprehensive network fault diagnosis, planning, and performance tuning information and allows for interoperability between SNMP management stations and monitoring agents.

RELATED DOCUMENTS

The following Enterasys Networks documents may help you to set up, control, and manage the SecureStack A2 device:

- *Ethernet Technology Guide*
- *Cabling Guide*
- *SecureStack A2 Installation Guide(s)*
- *SecureStack Redundant Power System Installation Guide*

Documents listed above, can be obtained from the World Wide Web in Adobe Acrobat Portable Document Format (PDF) at the following web site:

CONVENTIONS USED IN THIS GUIDE

The following conventions are used in the text of this document:

Convention	Description
Bold font	Indicates mandatory keywords, parameters or keyboard keys.
<i>italic font</i>	Indicates complete document titles.
<code>Courier font</code>	Used for examples of information displayed on the screen.
<i>Courier font in italics</i>	Indicates a user-supplied value, either required or optional.
[]	Square brackets indicate an optional value.
{ }	Braces indicate required values. One or more values may be required.
	A vertical bar indicates a choice in values.
[x y z]	Square brackets with a vertical bar indicates a choice of a value.
{x y z}	Braces with a vertical bar indicate a choice of a required value.
[x {y z}]	A combination of square brackets with braces and vertical bars indicates a required choice of an optional value.

The following icons are used in this guide:

NOTE: Calls the reader's attention to any item of information that may be of special importance.

CAUTION: Contains information essential to avoid damage to the equipment.

PRECAUCIÓN: Contiene información esencial para prevenir dañar el equipo.

ACHTUNG: Verweist auf wichtige Informationen zum Schutz gegen Beschädigungen.

Introduction

This chapter provides an overview of the SecureStack A2's unique features and functionality, an overview of the tasks that may be accomplished using the CLI interface, an overview of ways to manage the switch, and information on how to contact Enterasys Networks for technical support.

Important Notice

Depending on the firmware version you are using, some features described in this document may not be supported. Refer to the Release Notes shipped with the your switch to determine which features are supported.

1.1 SECURESTACK A2 CLI OVERVIEW

Enterasys Networks' SecureStack A2 CLI interface allows you to perform a variety of network management tasks, including the following:

- Assign IP address and subnet mask.
- Select a default gateway.
- Assign a login password to the switch for additional security.
- Download a new firmware image.
- Designate which network management workstations receive SNMP traps from the switch.
- View switch statistics.
- Manage configuration files.
- Assign ports to operate in the standard or full duplex mode.
- Control the number of received broadcasts that are switched to the other interfaces.
- Set port configurations and port-based VLANs.

- Configure ports to prioritize and assign a VLAN or Class of Service to incoming frames based on Layer 2, Layer 3, and Layer 4 information.
- Configure the switch to operate as a Generic Attribute Registration Protocol (GARP) device to dynamically create VLANs across a switched network.
- Redirect frames according to a port or VLAN and transmit them on a preselected destination port.
- Configure Spanning Trees.
- Clear NVRAM.
- Configure security methods, including 802.1X, RADIUS, SSHv2, and MAC locking.

1.2 DEVICE MANAGEMENT METHODS

The SecureStack A2 switch can be managed using the following methods:

- Locally using a VT type terminal connected to the console port.
- Remotely using a VT type terminal connected through a modem.
- Remotely using an SNMP management station.
- In-band through a Telnet connection.
- In-band using Enterasys Networks' NetSight® management application.
- Remotely using WebView™, Enterasys Networks' embedded web server application.

The *SecureStack A2 Installation Guide* provides setup instructions for connecting a terminal or modem to the SecureStack A2 switch.

1.3 GETTING HELP

For additional support related to this switch or document, contact Enterasys Networks using one of the following methods:

World Wide Web	http://www.enterasys.com/services/support/
Phone	1-800-872-8440 (toll-free in U.S. and Canada) or 1-978-684-1000 For the Enterasys Networks Support toll-free number in your country: http://www.enterasys.com/services/support/contact/
Internet mail	support@enterasys.com To expedite your message, type [SWITCHING] in the subject line.

To send comments or suggestions concerning this document to the Technical Publications Department:

techpubs@enterasys.com

Make sure to include the document Part Number in the email message.

Before calling Enterasys Networks, have the following information ready:

- Your Enterasys Networks service contract number
- A description of the failure
- A description of any action(s) already taken to resolve the problem (for example, changing mode switches, rebooting the unit)
- The serial and revision numbers of all involved Enterasys Networks products in the network
- A description of your network environment (layout, cable type, and so on)
- Network load and frame size at the time of trouble (if known)
- The switch history (for example, have you returned the switch before, is this a recurring problem?)
- Any previous Return Material Authorization (RMA) numbers

Startup and General Configuration

This chapter describes factory default settings and the Startup and General Configuration set of commands.

2.1 STARTUP AND GENERAL CONFIGURATION SUMMARY

At startup, the SecureStack A2 switch is configured with many defaults and standard features. The following sections provide information on how to review and change factory defaults, and how to customize basic system settings to adapt to your work environment.

2.1.1 Factory Default Settings

[Table 2-1](#) lists default settings for SecureStack A2 switch operation.

Table 2-1 Default Switch Settings

Feature	Default Setting
CDP discovery protocol	Auto enabled on all ports.
CDP authentication code	Set to 00-00-00-00-00-00-00
CDP hold time	Set to 180 seconds.
CDP interval	Transmit frequency of CDP messages set to 60 seconds.
Community name	Public.
EAPOL	Disabled.
EAPOL authentication mode	When enabled, set to auto for all ports.
GARP timer	Join timer set to 20 centiseconds; leave timer set to 60 centiseconds; leaveall timer set to 1000 centiseconds.

Table 2-1 Default Switch Settings (Continued)

Feature	Default Setting
GVRP	Globally enabled.
IGMP	Disabled. When enabled, query interval is set to 260 seconds and response time is set to 10 seconds.
IP mask and gateway	Subnet mask set to 0.0.0.0 ; default gateway set to 0.0.0.0
IP routes	No static routes configured.
Jumbo frame support	Disabled on all ports.
Link aggregation control protocol (LACP)	Enabled.
Link aggregation admin key	Set to 32768 for all ports.
Link aggregation flow regeneration	Disabled.
Link aggregation system priority	Set to 32768 for all ports.
Link aggregation output algorithm	Set to DIP-SIP.
Lockout	Set to disable Read-Write and Read-Only users, and to lockout the default admin (Super User) account for 15 minutes, after 3 failed login attempts,
Logging	Syslog port set to UDP port number 514 . Logging severity level set to 6 (significant conditions) for all applications.
MAC aging time	Set to 300 seconds.
MAC locking	Disabled (globally and on all ports).
Passwords	Set to an empty string for all default user accounts. User must press ENTER at the password prompt to access CLI.
Password aging	Disabled.
Password history	No passwords are checked for duplication.
Port auto-negotiation	Enabled on all ports.
Port advertised ability	Maximum ability advertised on all ports.

Table 2-1 Default Switch Settings (Continued)

Feature	Default Setting
Port broadcast suppression	Enabled and set to limit broadcast packets to 14,881 per second on all switch ports.
Port duplex mode	Set to half duplex, except for 100BASE-FX and 1000BASE-X, which is set to full duplex.
Port enable/disable	Enabled.
Port priority	Set to 1 .
Port speed	Set to 10 Mbps, except for 1000BASE-X, which is set to 1000 Mbps, and 100 BASE-FX, which is set to 100 Mbps.
Port trap	All ports are enabled to send link traps.
Priority classification	Classification rules are automatically enabled when created.
RADIUS client	Disabled.
RADIUS last resort action	When the client is enabled, set to Challenge .
RADIUS retries	When the client is enabled, set to 3 .
RADIUS timeout	When the client is enabled, set to 20 seconds.
Rate limiting	Disabled (globally and on all ports).
SNMP	Enabled.
SNTP	Disabled.
Spanning Tree	Globally enabled and enabled on all ports.
Spanning Tree edge port administrative status	Edge port administrative status begins with the value set to false initially after the device is powered up. If a Spanning Tree BDPU is not received on the port within a few seconds, the status setting changes to true .
Spanning Tree edge port delay	Enabled.
Spanning Tree forward delay	Set to 15 seconds.
Spanning Tree hello interval	Set to 2 seconds.
Spanning Tree ID (SID)	Set to 0 .

Table 2-1 Default Switch Settings (Continued)

Feature	Default Setting
Spanning Tree maximum aging time	Set to 20 seconds.
Spanning Tree port priority	All ports with bridge priority are set to 128 (medium priority).
Spanning Tree priority	Bridge priority is set to 32768 .
Spanning Tree version	Set to mstp (Multiple Spanning Tree Protocol).
SSH	Disabled.
System baud rate	Set to 9600 baud.
System contact	Set to empty string.
System location	Set to empty string.
System name	Set to empty string.
Terminal	CLI display set to 80 columns and 24 rows.
Timeout	Set to 5 minutes.
User names	Login accounts set to ro for Read-Only access; rw for Read-Write access; and admin for Super User access.
VLAN dynamic egress	Disabled on all VLANs.
VLAN ID	All ports use a VLAN identifier of 1 .

2.1.2 CLI “Command Defaults” Descriptions

Each command description in this guide includes a section entitled “Command Defaults” which contains different information than the factory default settings on the switch as described in [Table 2-1](#). The command defaults section defines CLI behavior if the user enters a command without typing optional parameters (indicated by square brackets []). For commands without optional parameters, the defaults section lists “None”. For commands with optional parameters, this section describes how the CLI responds if the user opts to enter only the keywords of the command syntax. [Figure 2-1](#) provides an example.

Figure 2-1 Sample CLI Default Description

show port status [*port-string*]

Command Defaults

If *port-string* is not specified, status information for all ports will be displayed.

2.1.3 CLI Command Modes

Each command description in this guide includes a section entitled “Command Mode” which states whether the command is executable in Admin (Super User), Read-Write, or Read-Only mode. Users with Read-Only access will only be permitted to view Read-Only (**show**) commands. Users with Read-Write access will be able to modify all modifiable parameters in **set** and **show** commands, as well as view Read-Only commands. Administrators or Super Users will be allowed all Read-Write and Read-Only privileges, and will be able to modify local user accounts. The SecureStack A2 switch indicates which mode a user is logged in as by displaying one of the following prompts:

- Admin: A2 (su) ->
- Read-Write: A2 (rw) ->
- Read-Only: A2 (ro) ->

NOTE: Depending on which switch you are using, your default command prompt may be different from the examples shown.

2.1.4 Using and Configuring WebView

Purpose

WebView is the Enterasys Networks embedded web server for switch configuration and management tasks. By default, WebView is enabled on TCP port number 80 on the SecureStack A2 switch. You can verify WebView status, and enable or disable WebView, as described in the following sections. WebView can also be securely used over SSL port 443. By default SSL is disabled.

To use WebView, type the IP address of the switch in your browser. To use WebView over SSL, type in https:// then the IP address of the switch. Example: https://172.16.2.10 (SSL must be enabled on the switch first).

Commands

The commands to configure WebView and SSL are described below.

- show webview ([Section 2.1.4.1](#))
- set webview ([Section 2.1.4.2](#))
- show ssl ([Section 2.1.4.3](#))
- set ssl ([Section 2.1.4.4](#))

2.1.4.1 **show webview**

Use this command to display WebView status.

show webview

Syntax Description

None.

Command Defaults

None.

Command Mode

Read-Only.

Example

This example shows how to display WebView status:

```
A2 (rw) -> show webview
WebView is Enabled.
```

2.1.4.2 set webview

Use this command to enable or disable WebView on the switch.

```
set webview {enable [ssl-only] | disable}
```

Syntax Description

enable disable	Enable or disable WebView on the switch.
ssl-only	(Optional) Allow WebView access by means of SSL only.

Command Defaults

None.

Command Mode

Read-Write.

Example

This example shows how to disable WebView on the switch:

```
A2 (rw) ->set webview disable
```

NOTE: It is good practice for security reasons to disable HTTP access on the switch when finished configuring with WebView, and then to only enable WebView on the switch when changes need to be made.

2.1.4.3 **show ssl**

Use this command to display SSL status.

show ssl

Syntax Description

None.

Command Defaults

None.

Command Mode

Read-Only.

Example

This example shows how to display SSL status:

```
A2 (rw) ->show ssl
SSL status: Enabled
```

2.1.4.4 set ssl

Use this command to enable or disable the use of WebView over SSL port 443. By default, SSL is disabled on the switch. This command can also be used to reinitialize the hostkey that is used for encryption.

```
set ssl {enable | disable | reinitialize | hostkey reinitialize}
```

Syntax Description

enable disable	Enable or disable the ability to use WebView over SSL.
reinitialize	Stops and then restarts the SSL process.
hostkey reinitialize	Stops SSL, regenerates new keys, and then restarts SSL.

Command Defaults

None.

Command Mode

Read-Write.

Example

This example shows how to enable SSL:

```
A2 (rw) ->set ssl enabled
```

2.1.5 Process Overview: CLI Startup and General Configuration

Use the following steps as a guide to the startup and general configuration process:

1. Starting and navigating the Command Line Interface (CLI) ([Section 2.1.6](#))
2. Configuring switch operation in a stack ([Section 2.1.10](#))
3. Setting user accounts and passwords ([Section 2.1.11](#))
4. Setting basic switch properties ([Section 2.1.12](#))
5. Configuring Power over Ethernet (PoE) ([Section 2.1.13](#))
6. Downloading a new firmware image ([Section 2.1.14](#))
7. Starting and configuring Telnet ([Section 2.1.15](#))
8. Managing image and configuration files ([Section 2.1.16](#))
9. Configuring the CDP discovery protocol ([Section 2.1.17](#))
10. Clearing and closing the CLI ([Section 2.1.18](#))
11. Resetting the switch ([Section 2.1.19](#))

2.1.6 Starting and Navigating the Command Line Interface

2.1.6.1 Using a Console Port Connection

NOTE: By default, the SecureStack A2 switch is configured with three user login accounts: **ro** for Read-Only access; **rw** for Read-Write access; and **admin** for super-user access to all modifiable parameters. The default password is set to a blank string. For information on changing these default settings, refer to [Section 2.1.11](#).

Once you have connected a terminal to the local console port as described in your *SecureStack A2 Installation Guide*, the startup screen, [Figure 2-2](#), will display. You can now start the Command Line Interface (CLI) by

- using a default user account, as described in [Section 2.1.6.2](#), or
- using an administratively-assigned user account as described in [Section 2.1.6.3](#).

2.1.6.2 Logging in with a Default User Account

If this is the first time you are logging in to the SecureStack A2 switch, or if the default user accounts have not been administratively changed, proceed as follows:

1. At the login prompt, enter one of the following default user names:
 - **ro** for Read-Only access,
 - **rw** for Read-Write access.
 - **admin** for Super User access.
2. Press ENTER. The Password prompt displays.
3. Leave this string blank and press ENTER. The switch information and prompt displays as shown in [Figure 2-2](#).

2.1.6.3 Logging in with an Administratively Configured User Account

If the switch's default user account settings have been changed, proceed as follows:

1. At the login prompt, enter your administratively-assigned user name and press ENTER.
2. At the Password prompt, enter your password and press ENTER.

The notice of authorization and prompt displays as shown in [Figure 2-2](#).

NOTE: Users with Read-Write (rw) and Read-Only access can use the **set password** command ([Section 2.1.11.4](#)) to change their own passwords. Administrators with Super User (su) access can use the **set system login** command ([Section 2.1.11.2](#)) to create and change user accounts, and the **set password** command to change any local account password.

2.1.6.4 Using a Telnet Connection

Once the SecureStack series has a valid IP address, you can establish a Telnet session from any TCP/IP based node on the network as follows.

1. Telnet to the switch's IP address.
2. Enter login (user name) and password information in one of the following ways:
 - If the switch's default login and password settings have not been changed, follow the steps listed in [Section 2.1.6.2](#), or
 - Enter an administratively-configured user name and password.

The notice of authorization and prompt displays as shown in [Figure 2-2](#).

For information about setting the IP address, refer to [Section 2.1.12.3](#).

For information about configuring Telnet settings, refer to [Section 2.1.15](#).

Refer to the instructions included with the Telnet application for information about establishing a Telnet session.

Figure 2-2 SecureStack A2 Startup Screen

Serial Number: 1234567
Firmware Revision: 01.00.26

A2(su)->
```

2.1.7 Getting Help with CLI Syntax

The SecureStack A2 switch allows you to display usage and syntax information for individual commands by typing **help** or **?** after the command.

2.1.7.1 Performing Keyword Lookups

Entering a space and a question mark (?) after a keyword will display all commands beginning with the keyword. [Figure 2-3](#) shows how to perform a keyword lookup for the **show snmp** command. In this case, 4 additional keywords are used by the **show snmp** command. Entering a space and a question mark (?) after any of these parameters (such as **show snmp community**) will display additional parameters nested within the syntax.

Figure 2-3 Performing a Keyword Lookup

```
A2 (rw) ->show snmp ?

community          SNMP v1/v2c community name configuration.
notify              SNMP notify configuration
targetaddr          SNMP target address configuration
targetparams        SNMP target parameters configuration
```

Entering a question mark (?) without a space after a partial keyword will display a list of commands that begin with the partial keyword. [Figure 2-4](#) shows how to use this function for all commands beginning with **co**:

Figure 2-4 Performing a Partial Keyword Lookup

```
A2 (rw->co?
configure          copy
A2 (rw) ->co
```

NOTE: At the end of the lookup display, the system will repeat the command you entered without the ?.

2.1.7.2 Displaying Scrolling Screens

If the CLI screen length has been set using the **set length** command as described in [Section 2.1.12.25](#), CLI output requiring more than one screen will display `--More--` to indicate continuing screens. To display additional screen output:

- Press any key other than ENTER to advance the output one screen at a time.
- Press ENTER to advance the output one line at a time.

The example in [Figure 2-5](#) shows how the **show mac address** command indicates that output continues on more than one screen.

Figure 2-5 Scrolling Screen Output

A2 (rw)->**show macaddress**

MAC Address	FID	Port	Type

00-00-1d-67-68-69	1	host.0.1	learned
00-00-02-00-00-00	1	fe.1.2	learned
00-00-02-00-00-01	1	fe.1.3	learned
00-00-02-00-00-02	1	fe.1.4	learned
00-00-02-00-00-03	1	fe.1.5	learned
00-00-02-00-00-04	1	fe.1.6	learned
00-00-02-00-00-05	1	fe.1.7	learned
00-00-02-00-00-06	1	fe.1.8	learned
00-00-02-00-00-07	1	fe.1.9	learned
00-00-02-00-00-08	1	fe.1.10	learned
--More--			

2.1.8 Abbreviating and Completing Commands

The SecureStack A2 switch allows you to abbreviate CLI commands and keywords down to the number of characters that will allow for a unique abbreviation. [Figure 2-6](#) shows how to abbreviate the **show netstat** command to **sh net**.

Figure 2-6 Abbreviating a Command

A2 (rw) -> sh net						
Active Internet connections (including servers)						
Proto	Recv-Q	Send-Q	Local Address	Foreign Address	State	
-----	-----	-----	-----	-----	-----	
TCP	0	0	10.21.73.13.23	134.141.190.94.51246	ESTABLISHED	
TCP	0	275	10.21.73.13.23	134.141.192.119.4724	ESTABLISHED	
TCP	0	0	*.80	*.*	LISTEN	
TCP	0	0	*.23	*.*	LISTEN	
UDP	0	0	10.21.73.13.1030	134.141.89.113.514		
UDP	0	0	*.161	*.*		
UDP	0	0	*.1025	*.*		
UDP	0	0	*.123	*.*		

2.1.9 Basic Line Editing Commands

The CLI supports EMACs-like line editing commands. [Table 2-2](#) lists some commonly used commands.

Table 2-2 Basic Line Editing Commands

Key Sequence	Command
Ctrl+A	Move cursor to beginning of line.
Ctrl+B	Move cursor back one character.
Ctrl+D	Delete a character.
Ctrl+E	Move cursor to end of line.
Ctrl+F	Move cursor forward one character.
Ctrl+H	Delete character to left of cursor.
Ctrl+I or TAB	Complete word.
Ctrl+K	Delete all characters after cursor.
Ctrl+N	Scroll to next command in command history (use the CLI history command to display the history).
Ctrl+P	Scroll to previous command in command history.
Ctrl+Q	Resume the CLI process.
Ctrl+S	Pause the CLI process (for scrolling).
Ctrl+T	Transpose characters.
Ctrl+U or Ctrl+X	Delete all characters before cursor.
Ctrl+W	Delete word to the left of cursor.
Ctrl+Y	Restore the most recently deleted item.

2.1.10 Configuring Switches in a Stack

About SecureStack A2 Switch Operation in a Stack

The SecureStack A2 products are stackable switches that can be adapted and scaled to help meet your network needs. These switches provide a management platform and uplink to a network backbone for a stacked group of up to eight SecureStack A2 switches.

NOTE: It is possible on a standalone A2 switch to configure the two stack ports as standard Gigabit Ethernet Ports. For more information refer to [Section 2.1.10.1](#).

Once installed in a stack, the switches behave and perform as a single unit. As such, you can start with a single unit and add more units as your network expands. You can also mix different products in the family in a single stack to provide a desired combination of port types and functions to match the requirements of individual applications. In all cases, a stack of units performs as one large product, and is managed as a single network entity.

When switches are installed and connected as described in the *SecureStack A2 Installation Guide*, the following occurs during initialization:

- The switch that will manage the stack is automatically established. This is known as the manager switch.
- All other switches are established as members in the stack.
- The hierarchy of the switches that will assume the function of backup manager is also determined in case the current manager malfunctions, is powered down, or is disconnected from the stack.
- The console port on the manager switch remains active for out-of-band (local) switch management, but the console port on each member switch is deactivated. This enables you to set the IP address and system password using a single console port. Now each switch can be configured locally using only the manager's console port, or inband using a remote device and the CLI set of commands described in this section.

Once a stack is created (more than one switch is interconnected), the following procedure occurs:

1. By default, unit IDs are arbitrarily assigned on a first-come, first-served basis.
2. Unit IDs are saved against each unit. Then, every time a board is power-cycled, it will initialize with the same unit ID. This is important for port-specific information (for example: fe.4.12 is the 12th Fast Ethernet port on Unit # 4).

3. The management election process uses the following precedence to assign a management switch:
 - a. Previously assigned / elected management unit
 - b. Management assigned priority (values 1-15)
 - c. Hardware preference level
 - d. Highest MAC Address

Use the following recommended procedures when installing a new stackable system or adding a new unit to an existing stack.

Important

The following procedures assume that all units have a clean configuration from manufacturing. When adding a new unit to an already running stack, it is also assumed that the new unit is using the same firmware image version as other units in the stack.

Installing a New Stackable System of Up to Eight Units

Use the following procedure for installing a new stack of up to eight units out of the box.

1. Before applying power, make sure **all** physical connections with the stack cables are the same as described in the SecureStack A2 Installation Guide.
2. Once all of the stack cables have been connected, individually power on each unit from top to bottom.

NOTES: Ensure that each switch is fully operational before applying power to the next switch. Since unit IDs are assigned on a first-come, first-served basis, this will ensure that unit IDs are ordered sequentially.

Once unit IDs are assigned, they are persistent and will be retained during a power cycle to any or all of the units.

3. (Optional) If desired, change the management unit using the **set switch movemanagement** command as described in [Section 2.1.10.8](#).
4. Once the desired master unit has been selected, reset the system using the **reset** command as described in [Section 2.1.19.2](#).
5. After the stack has been configured, you can use the **show switch unit** command ([Section 2.1.10.2](#)) to physically identify each unit. When you enter the command with a unit number, the MGR LED of the specified switch will blink for 10 seconds. The normal state of this LED is off for member units and steady green for the manager unit.

Installing a Previously-Configured System of Up to Eight Units

If member units in a stack have been previous members of a different stack, you may need to configure the renumbering of the stack as follows:

1. Stack the units in the method desired, and connect the stack cables.
2. Power up only the unit you wish to be manager.
3. Once the management unit is powered up, log into the CLI, and use the **show switch** command as described in [Section 2.1.10.2](#) to display stacking information.
4. Clear any switches which are listed as “unassigned” using the **clear switch member** command as described in [Section 2.1.10.10](#).
5. Power up the member of the stack you wish to become unit 2. Once the second unit is fully powered, the COM session of the CLI will state that a new CPU was added.
6. Use the **show switch** command to redisplay stacking information.
 - a. If the new member displays as unit 2, you can proceed to repeat this step with the next unit.
 - b. If the new member displays a different unit number, you must:
 - Renumber the stack using the **set switch renumber** command as described in [Section 2.1.10.6](#), then
 - Clear the original unit number using the **clear switch member** command.
7. Repeat Step 6 until all members have been renumbered in the order you desire.
8. After the stack has been reconfigured, you can use the **show switch unit** command ([Section 2.1.10.2](#)) to physically confirm the identity of each unit. When you enter the command with a unit number, the MGR LED of the specified switch will blink for 10 seconds. The normal state of this LED is off for member units and steady green for the manager unit.

Adding a New Unit to an Existing Stack

Use the following procedure for installing a new unit to an existing stack configuration. This procedure assumes that the new unit being added has a clean configuration from manufacturing and is running the same firmware image version as other units in the stack.

1. Ensure that power is off on the new unit being installed.
2. Use one of the following methods to complete stack cable connections:
 - If the running stack uses a daisy chain configuration, make the stack cable connections from the bottom of the stack to the new unit (that is, STACK DOWN port from the bottom unit of the running stack to the STACK UP port on the new unit).

- If the running stack uses a closed loop configuration, break the loop and make the stack cable connections to the new unit to close the loop.
3. Apply power to the new unit.

Creating a Virtual Switch Configuration

You can create a configuration for a SecureStack A2 switch before adding the actual physical device to a stack. This preconfiguration feature includes configuring protocols on the ports of the “virtual switch.”

To create a virtual switch configuration in a stack environment:

1. Display the types of switches supported in the stack, using the **show switch switchtype** command (Section 2.1.10.3).
2. Using the output of the **show switch switchtype** command, determine the switch index (SID) of the model of switch being configured.
3. Add the virtual switch to the stack using the **set switch member** command (Section 2.1.10.9). Use the SID of the switch model, determined in the previous step, and the unit ID that you want to assign to this switch member.
4. Proceed to configure the ports of the virtual switch as you would do for physically present devices.

The following example adds a A2H124-48P model (SID is 4) to a stack as unit 2 of the stack. The first port on that virtual switch (fe.2.1) is then associated with VLAN 555.

A2(su)->show switch switchtype

SID	Switch Model	ID	Mgmt Pref	Code Version
1	A2H124-24P		1	0xa08245
2	A2H124-24		1	0xa08245
3	A2H124-48		1	0xa08245
4	A2H124-48P		1	0xa08245
5	A2H124-24FX		1	0xa08245
6	A2H254-16		1	0xa08245

A2(su)->set switch member 2 4

A2(su)->show switch

Switch	Management Status	Preconfig Model ID	Plugged-in Model ID	Switch Status	Code Version
1	Mgmt Switch	A2H124-48	A2H124-48	OK	01.03.22
2	Unassigned	A2H124-48P		Not Present	00.00.00

```
A2 (su) -> set vlan create 555
A2 (su) -> clear vlan egress 1 fe.2.1
A2 (su) -> set port vlan fe.2.1 555 untagged
A2 (su) -> show port vlan fe.2.1
fe.2.1 is set to 555
```

Considerations About Using Clear Config in a Stack

When using the **clear config** command (as described in [Section 2.1.19.2](#)) to clear configuration parameters in a stack, it is important to remember the following:

- Use **clear config** to clear config parameters without clearing stack unit IDs. This command WILL NOT clear stack parameters or the IP address and avoids the process of re-numbering the stack.
- Use **clear config all** when it is necessary to clear all config parameters, including stack unit IDs and switch priority values. This command will not clear the IP address.
- Use **clear ip address** to remove the IP address of the stack.

Configuration parameters and stacking information can also be cleared **on the master unit only** by selecting the “restore configuration to factory defaults” option from the boot menu on switch startup. This selection will leave stacking priorities on all other units.

Using Clear Config on a Standalone A2 with the Uplink Ports Configured as Standard Gigabit Ethernet Ports

When using the **clear config** command (as described in [Section 2.1.19.2](#)) to clear configuration parameters on a standalone A2 switch with the uplink ports configured as standard Ethernet ports, it is important to remember the following:

- The **clear config** command WILL NOT set the front panel uplink ports back to stack ports.
- The **clear config all** command WILL set the front panel uplink ports back to stack ports.

Purpose

To review, individually configure and manage switches in a SecureStack A2 stack.

Commands

The commands used to review, individually configure and manage switches in a SecureStack A2 stack are listed below and described in the associated section as shown.

- set switch stack-port ([Section 2.1.10.1](#))
- show switch ([Section 2.1.10.2](#))

- show switch switchtype ([Section 2.1.10.3](#))
- show switch stack-ports ([Section 2.1.10.4](#))
- set switch ([Section 2.1.10.5](#))
- set switch copy-fw ([Section 2.1.10.6](#))
- set switch description ([Section 2.1.10.7](#))
- set switch movemanagement ([Section 2.1.10.8](#))
- set switch member ([Section 2.1.10.9](#))
- clear switch member ([Section 2.1.10.10](#))

2.1.10.1 set switch stack-port

Use this command to configure the two front panel uplink ports as standard Gigabit Ethernet ports or stack ports.

set switch stack-port {ethernet | stack}

NOTES: Use this command only on standalone (non-stacked) A2 switches.

Using this command will cause a switch reset.

Do not stack A2 switches with uplink ports that are in Ethernet mode.

Syntax Description

ethernet stack	Change the two front panel stack ports to Ethernet mode or Stacking mode.
-------------------------	---

Command Defaults

By default, the front panel uplink ports are in stack mode.

Command Mode

Read-Write.

Example

This example shows how to set the front panel stacking ports as Gigabit Ethernet ports:

```
A2(su)->set switch stack-port ethernet
This command will reset the entire system.
Do you want to continue (y/n) [n]?y
```

NOTE: The front panel Stacking Ports will only be displayed in the **show port status** command when they are in Ethernet mode.

When the front panel uplink ports are configured in Ethernet mode the **clear config** command will not change the uplink ports back to Stacking mode. The **clear config all** command will change the uplink ports back to Stacking mode.

2.1.10.2 show switch

Use this command to display information about one or more units in the stack. After a stack has been configured, you can use this command to physically confirm the identity of each unit. When you enter the command with a unit number, the MGR LED of the specified switch will blink for 10 seconds. The normal state of this LED is off for member units and steady green for the manager unit.

```
show switch [status] [unit]
```

Syntax Description

status	(Optional) Displays power and administrative status information for one or more units in the stack.
unit	(Optional) Specifies the unit(s) for which information will display.

Command Defaults

If not specified, status and other configuration information about all units will be displayed.

Command Mode

Read-Only.

Examples

This example shows how to display information about all switch units in the stack:

A2 (rw) ->show switch						
Switch	Management Status	Preconfig Model ID	Plugged-in Model ID	Switch Status	Code Version	
1	Stack Member	A2H124-24	A2H124-24	OK	01.00.26	
2	Stack Member	A2H124-24	A2H124-24	OK	01.00.26	
3	Stack Member	A2H124-48	A2H124-48	OK	01.00.26	
4	Stack Member	A2H124-24P	A2H124-24P	OK	01.00.26	
5	Stack Member	A2H124-48	A2H124-48	OK	01.00.26	
6	Stack Member	A2H124-24P	A2H124-24P	OK	01.00.26	
7	Mgmt Switch	A2H124-48P	A2H124-48P	OK	01.00.26	

This example shows how to display information for switch unit 1 in the stack:

```
A2(rw)->show switch 1
Switch                               1
Management Status                   Management Switch
Hardware Management Preference      Unassigned
Admin Management Preference         Unassigned
Switch Type                         A2H124-48
Preconfigured Model Identifier      A2H124-48
Plugged-in Model Identifier         A2H124-48
Switch Status                       OK
Switch Description                  Enterasys Networks, Inc. A2 -- Model
                                   A2H124-48
Detected Code Version               01.00.26
Detected Code in Flash              01.00.26
Detected Code in Back Image        01.00.25
Up Time                            0 days 0 hrs 0 mins 34 secs
A2(su)->
```

This example shows how to display status information for switch unit 1 in the stack:

```
A2(rw)->show switch status 1
Switch                               1
Switch Status                       Full
Admin State                         Power State
Inserted Switch:
  Model Identifier                   A2H124-48
  Description                        Enterasys Networks, Inc. A2 -- Model
                                   A2H124-48
Configured Switch:
  Model Identifier                   A2H124-48
  Description                        Enterasys Networks, Inc. A2 -- Model
                                   A2H124-48
A2(su)->
```

2.1.10.3 show switch switchtype

Use this command to display information about supported switch types in the stack.

show switch switchtype

Syntax Description

None.

Command Defaults

None.

Command Mode

Read-Only.

Examples

This example shows how to display switch type information about all switches in the stack:

A2 (rw) -> show switch switchtype					
SID		Switch Model ID	Mgmt Pref	Code Version	

1	A2H124-24P		1	0xa08245	
2	A2H124-24		1	0xa08245	
3	A2H124-48		1	0xa08245	
4	A2H124-48P		1	0xa08245	
5	A2H124-24FX		1	0xa08245	
A2 (su) ->					

This example shows how to display switch type information about switch 1 in the stack:

A2 (ro) -> show switch switchtype 1	
Switch Type	0x56540002
Model Identifier	A2H124-24P
Switch Description	Enterasys Networks, Inc. A2 --
	Model A2H124-24P
Management Preference	1
Expected Code Version	0xa08245
Supported Cards:	
Slot	0
Card Index (CID)	10
Model Identifier	A2H124-24P

2.1.10.4 show switch stack-ports

Use this command to display various data flow and error counters on stack ports.

show switch stack-ports

Syntax Description

None.

Command Defaults

None.

Command Mode

Read-Only.

Examples

This example shows how to display data and error information on stack ports:

A2 (rw) ->**show switch stack-ports**

Switch	Stacking Port	-----TX-----			-----RX-----		
		Data Rate (Mb/s)	Error Rate (Errors/s)	Total Errors	Data Rate (Mb/s)	Error Rate (Errors/s)	Total Errors
1	Up	0	0	0	0	0	0
	Down	0	0	0	0	0	0

2.1.10.5 set switch

Use this command to assign a switch ID, to set a switch’s priority for becoming the management switch if the previous management switch fails, or to change the switch unit ID for a switch in the stack.

set switch {*unit* [**priority** *value* | **renumber** *newunit*]}

Syntax Description

<i>unit</i>	Specifies a unit number for the switch.
priority <i>value</i>	Specifies a priority value for the unit. Valid values are 1-15 with higher values assigning higher priority.
renumber <i>newunit</i>	Specifies a new number for the unit.
<div>NOTE: This number must be a previously unassigned unit ID number.</div>	

Command Defaults

None.

Command Mode

Read-Write.

Examples

This example shows how to assign priority 3 to switch 5:

```
A2 (rw) -> set switch 5 priority 3
```

This example shows how to renumber switch 5 to switch 7:

```
A2 (rw) -> set switch 5 renumber 7
```

2.1.10.6 set switch copy-fw

Use this command to replicate the code image file from the management switch to other switch(es) in the stack.

set switch copy-fw [**destination-system** *unit*]

Syntax Description

destination-system <i>unit</i>	(Optional) Specifies the unit number of unit on which to copy the management image file.
--	--

Command Defaults

If **destination-system** is not specified, the management image file will be replicated to all switches in the stack.

Command Mode

Read-Write.

Example

This example shows how to replicate the management image file to all switches in the stack:

```
A2(rw)->set switch copy-fw
Are you sure you want to copy firmware? (y/n) y

Code transfer completed successfully.
```

2.1.10.7 set switch description

Use this command to assign a name to a switch in the stack.

set switch description *unit description*

Syntax Description

<i>unit</i>	Specifies a unit number for the switch.
<i>description</i>	Specifies a text description for the unit.

Command Defaults

None.

Command Mode

Read-Write.

Example

This example shows how to assign the name “FirstUnit” to switch unit 1 in the stack:

```
A2 (rw) -> set switch description 1 FirstUnit
```

2.1.10.8 set switch movemanagement

Use this command to move management switch functionality from one switch to another.

set switch movemanagement *fromunit tounit*

Syntax Description

<i>fromunit</i>	Specifies the unit number of the current management switch.
<i>tounit</i>	Specifies the unit number of the newly-designated management switch.

Command Defaults

None.

Command Mode

Read-Write.

Example

This example shows how to move management functionality from switch 1 to switch 2:

```
A2(rw)->set switch movemenagement 1 2
Moving stack management will unconfigure entire stack including all interfaces.
Are you sure you want to move stack management? (y/n) y
```

2.1.10.9 set switch member

Use this command to specify a unit as a non-existent member of a future stack.

set switch member *unit switch-id*

Syntax Description

<i>unit</i>	Specifies a unit number for the switch.
<i>switch-id</i>	Specifies a switch ID number for the switch.

Command Defaults

None.

Command Mode

Read-Write.

Example

This example shows how to specify a switch as unit 1 with an switch ID of 1:

A2 (rw) ->**set switch member 1 1**

2.1.10.10 clear switch member

Use this command to remove a member entry from the stack.

clear switch member *unit*

Syntax Description

<i>unit</i>	Specifies the unit number of the switch.
-------------	--

Command Defaults

None.

Command Mode

Read-Write.

Example

This example shows how to remove the switch 5 entry from the stack:

```
A2 (rw) ->clear switch member 5
```

2.1.11 Setting User Accounts and Passwords

Purpose

To change the switch's default user login and password settings, and to add new user accounts and passwords.

Commands

The commands used to configure user accounts and passwords are listed below and described in the associated section as shown.

- show system login ([Section 2.1.11.1](#))
- set system login ([Section 2.1.11.2](#))
- clear system login ([Section 2.1.11.3](#))
- set password ([Section 2.1.11.4](#))
- set system password length ([Section 2.1.11.5](#))
- set system password aging ([Section 2.1.11.6](#))
- set system password history ([Section 2.1.11.7](#))
- show system lockout ([Section 2.1.11.8](#))
- set system lockout ([Section 2.1.11.9](#))

2.1.11.1 show system login

Use this command to display user login account information.

show system login

Syntax Description

None.

Command Defaults

None.

Command Mode

Super User.

Example

This example shows how to display login account information. In this case, switch defaults have not been changed:

```
A2 (su) -> show system login
Password history size: 0
Password aging      : disabled

Username      Access      State
-----
admin         super-user  enabled
ro            read-only   enabled
rw            read-write  enabled
```

[Table 2-3](#) provides an explanation of the command output.

Table 2-3 show system login Output Details

Output	What It Displays...
Password history size	Number of previously used user login passwords that will be checked for duplication when the set password command is executed. Configured with set system password history (Section 2.1.11.7).
Password aging	Number of days user passwords will remain valid before aging out. Configured with set system password aging (Section 2.1.11.6).
Username	Login user names.

Table 2-3 show system login Output Details (Continued)

Output	What It Displays...
Access	Access assigned to this user account: super-user , read-write or read-only .
State	Whether this user account is enabled or disabled .

2.1.11.2 set system login

Use this command to create a new user login account, or to disable or enable an existing account. The SecureStack A2 switch supports up to 16 user accounts, including the admin account, which cannot be disabled or deleted.

```
set system login username {super-user | read-write | read-only} {enable | disable}
```

Syntax Description

<i>username</i>	Specifies a login name for a new or existing user. This string can be a maximum of 80 characters, although a maximum of 16 characters is recommended for proper viewing in the show system login display.
super-user read-write read-only	Specifies the access privileges for this user.
enable disable	Enables or disables the user account.
	NOTE: The default admin (su) account cannot be disabled.

Command Defaults

None.

Command Mode

Super User.

Example

This example shows how to enable a new user account with the login name “netops” with super user access privileges:

```
A2 (su) -> set system login netops super-user enable
```

2.1.11.3 clear system login

Use this command to remove a local login user account.

clear system login *username*

Syntax Description

<i>username</i>	Specifies the login name of the account to be cleared.
-----------------	--

NOTE: The default admin (su) account cannot be deleted.

Command Defaults

None.

Command Mode

Super User.

Example

This example shows how to remove the “netops” user account:

```
A2 (su) ->clear system login netops
```

2.1.11.4 set password

Use this command to change system default passwords or to set a new login password on the CLI.

set password [*username*]

Syntax Description

<i>username</i>	(Only available to users with super-user access.) Specifies a system default or a user-configured login account name. By default, the SecureStack A2 switch provides the following account names: <ul style="list-style-type: none"> • ro for Read-Only access. • rw for Read-Write access. • admin for Super User access. (This access level allows Read-Write access to all modifiable parameters, including user accounts.)
-----------------	--

Command Defaults

None.

Command Mode

Read-Write users can change their own passwords. Super Users (Admin) can change any password on the system.

Examples

This example shows how a super-user would change the Read-Write password from the system default (blank string):

```
A2(su)->set password rw
Please enter new password: *****
Please re-enter new password: *****
Password changed.
A2(su)->
```

This example shows how a user with Read-Write access would change his password:

```
A2(rw)->set password
Please enter old password: *****
Please enter new password: *****
Please re-enter new password: *****
Password changed.
A2(rw)->
```

2.1.11.5 set system password length

Use this command to set the minimum user login password length.

set system password length *characters*

Syntax Description

<i>characters</i>	Specifies the minimum number of characters for a user account password. Valid values are 0 to 40.
-------------------	---

Command Defaults

None.

Command Mode

Super User.

Example

This example shows how to set the minimum system password length to 8 characters:

```
A2 (su) -> set system password length 8
```

2.1.11.6 set system password aging

Use this command to set the number of days user passwords will remain valid before aging out, or to disable user account password aging.

set system password aging {*days* | **disable**}

Syntax Description

<i>days</i>	Specifies the number of days user passwords will remain valid before aging out. Valid values are 1 to 365 .
disable	Disables password aging.

Command Defaults

None.

Command Mode

Super User.

Example

This example shows how to set the system password age time to 45 days:

```
A2 (su) ->set system password aging 45
```

2.1.11.7 set system password history

Use this command to set the number of previously used user login passwords that will be checked for password duplication. This prevents duplicate passwords from being entered into the system with the **set password** command.

set system password history *size*

Syntax Description

<i>size</i>	Specifies the number of passwords checked for duplication. Valid values are 0 to 10 .
-------------	---

Command Defaults

None.

Command Mode

Super User.

Example

This example shows how to configure the system to check the last 10 passwords for duplication

A2 (su) ->**set system password history 10**

2.1.11.8 show system logout

Use this command to display settings for locking out users after failed attempts to log in to the system.

show system logout

Syntax Description

None.

Command Defaults

None.

Command Mode

Super User.

Example

This example shows how to display user logout settings. In this case, switch defaults have not been changed:

```
A2 (su) -> show system logout
Lockout attempts: 3
Lockout time:      15 minutes.
```

[Table 2-4](#) provides an explanation of the command output. These settings are configured with the **set system logout** command ([Section 2.1.11.9](#)).

Table 2-4 show system logout Output Details

Output	What It Displays...
Lockout attempts	Number of failed login attempts allowed before a read-write or read-only user's account will be disabled.
Lockout time	Number of minutes the default admin user account will be locked out after the maximum login attempts.

2.1.11.9 set system logout

Use this command to set the number of failed login attempts before locking out (disabling) a read-write or read-only user account, and the number of minutes to lockout the default admin super user account after maximum login attempts. Once a user account is locked out, it can only be re-enabled by a super user with the **set system login** command ([Section 2.1.11.2](#)).

```
set system logout {[attempts attempts] [time time]}
```

Syntax Description

attempts <i>attempts</i>	Specifies the number of failed login attempts allowed before a read-write or read-only user’s account will be disabled. Valid values are 1 to 10 .
time <i>time</i>	Specifies the number of minutes the default admin user account will be locked out after the maximum login attempts. Valid values are 0 to 60 .

Command Defaults

None.

Command Mode

Super User.

Example

This example shows how to set login attempts to 5 and lockout time to 30 minutes:

```
A2 (su) ->set system logout attempts 5 time 30
```

2.1.12 Setting Basic Device Properties

Purpose

To display and set the system IP address and other basic system (switch) properties, including time, contact name and version information.

Commands

The commands used to set basic system information are listed below and described in the associated section as shown.

- show ip address ([Section 2.1.12.1](#))
- show ip protocol ([Section 2.1.12.2](#))
- set ip address ([Section 2.1.12.3](#))
- clear ip address ([Section 2.1.12.4](#))
- show system ([Section 2.1.12.5](#))
- show system hardware ([Section 2.1.12.6](#))
- show system utilization ([Section 2.1.12.7](#))
- set system enhancedbuffermode ([Section 2.1.12.8](#))
- show time ([Section 2.1.12.9](#))
- set time ([Section 2.1.12.10](#))
- show summertime ([Section 2.1.12.11](#))
- set summertime ([Section 2.1.12.12](#))
- set summertime date ([Section 2.1.12.13](#))
- set summertime recurring ([Section 2.1.12.14](#))
- clear summertime ([Section 2.1.12.15](#))
- set prompt ([Section 2.1.12.16](#))
- show banner motd ([Section 2.1.12.17](#))
- set banner motd ([Section 2.1.12.18](#))
- clear banner motd ([Section 2.1.12.19](#))
- show version ([Section 2.1.12.20](#))

- set system name ([Section 2.1.12.21](#))
- set system location ([Section 2.1.12.22](#))
- set system contact ([Section 2.1.12.23](#))
- set width ([Section 2.1.12.24](#))
- set length ([Section 2.1.12.25](#))
- show logout ([Section 2.1.12.26](#))
- set logout ([Section 2.1.12.27](#))
- show console ([Section 2.1.12.28](#))
- set console baud ([Section 2.1.12.29](#))

2.1.12.1 show ip address

Use this command to display the system IP address and subnet mask.

show ip address

Syntax Description

None.

Command Defaults

None.

Command Mode

Read-Only.

Example

This example shows how to display the system IP address and subnet mask:

A2 (rw) -> show ip address		
Name	Address	Mask
-----	-----	-----
host	10.42.13.20	255.255.0.0

2.1.12.2 **show ip protocol**

Use this command to display the method used to acquire a network IP address for switch management.

show ip protocol

Syntax Description

None.

Command Defaults

None.

Command Mode

Read-Only.

Example

This example shows how to display the method used to acquire a network IP address:

```
A2 (rw) -> show ip protocol  
System IP address acquisition method: dhcp
```

2.1.12.3 set ip address

Use this command to set the system IP address, subnet mask and default gateway.

```
set ip address ip-address [mask ip-mask] [gateway ip-gateway]
```

Syntax Description

<i>ip-address</i>	Sets the IP address for the system. For SecureStack A2 stackable systems, this is the IP address of the management switch as described in Section 2.1.10 .
mask <i>ip-mask</i>	(Optional) Sets the system’s subnet mask.
gateway <i>ip-gateway</i>	(Optional) Sets the system’s default gateway (next-hop device).

Command Defaults

If not specified, *ip-mask* will be set to the natural mask of the *ip-address* and *ip-gateway* will be set to the *ip-address*.

Command Mode

Read-Write.

Example

This example shows how to set the system IP address to 10.1.10.1 with a mask of 255.255.128.0 and a default gateway of 10.1.0.1:

```
A2 (rw) ->set ip address 10.1.10.1 mask 255.255.128.0 gateway 10.1.0.1
```

2.1.12.4 clear ip address

Use this command to clear the system IP address.

clear ip address

Syntax Description

None.

Command Defaults

None.

Command Mode

Read-Write.

Example

This example shows how to clear the system IP address:

```
A2 (rw) ->clear ip address
```

2.1.12.5 show system

Use this command to display system information, including contact information, power and fan tray status and uptime.

show system

Syntax Description

None.

Command Defaults

None.

Command Mode

Read-Only.

Example

This example shows how to display system information:

```
A2 (rw) ->show system
System contact:
System location:
System name:

PS1-Status      PS2-Status
-----
ok              not installed

Fan1-Status
-----
ok

Uptime d,h:m:s  Logout
-----
0,0:30:29      5 min
```

Table 2-5 provides an explanation of the command output.

Table 2-5 show system Output Details

Output	What It Displays...
System contact	Contact person for the system. Default of a blank string can be changed with the set system contact command (Section 2.1.12.23).
System location	Where the system is located. Default of a blank string can be changed with the set system location command (Section 2.1.12.22).
System name	Name identifying the system. Default of a blank string can be changed with the set system name command (Section 2.1.12.21).
PS1 and PS2-Status	Operational status for power supply 1 and, if installed, power supply 2.
Fan Status	Operational status of the fan trays.
Uptime d,h:m:s	System uptime.
Logout	Time an idle console or Telnet CLI session will remain connected before timing out. Default of 5 minutes can be changed with the set logout command (Section 2.1.12.27).

2.1.12.6 show system hardware

Use this command to display the system's hardware configuration.

show system hardware

Syntax Description

None.

Command Defaults

None.

Command Mode

Read-Only.

Example

This example shows how to display the system's hardware configuration:

```
A2 (rw) -> show system hardware
SLOT HARDWARE INFORMATION
-----
Model:                               A2H124-24
Serial Number:                       041800129041
Vendor ID:                           0x0e10
Base MAC Address:                     00:01:F4:5F:1D:E0
Hardware Version:                     BCM5695 REV 2
FirmWare Version:                    01.00.25
Boot Code Version:                   01.00.17
```

2.1.12.7 show system utilization

Use this command to display detailed information about the processor running on the switch, or the overall memory usage of the Flash and SDRAM storage devices on the unit, or the processes running on the switch. Only the memory usage in the master unit of a stack is shown.

show system utilization {cpu | storage | process}

Syntax Description

cpu	Display information about the processor running on the switch.
storage	Display information about the overall memory usage on the switch.
process	Display information about the processes running on the switch.

Command Defaults

None.

Command Mode

Read-Only.

Examples

This example shows how to display the system’s cpu utilization:

```
A2(ro)->show system utilization cpu
Total CPU Utilization:

Switch   CPU      5 sec      1 min      5 min
-----
1         1         3%         1%         1%
```

This example shows how to display the system’s overall memory usage:

```
A2(su)->show system utilization storage
Storage Utilization:

Type      Description              Size(Kb)      Available (Kb)
-----
RAM       RAM device                131072        23217
Flash     Images, Config, Other     15740         2528
```

This example shows how to display information about the processes running on the system. Only partial output is shown.

```
A2(su)->show system utilization process
```

```
Switch:1      CPU:1
```

TID	Name	5Sec	1Min	5Min

...				

2.1.12.8 set system enhancedbuffermode

Use this command to enable or disable enhanced buffer mode, which optimizes buffer distribution for non-stacking single CoS queue operation. Executing this command will reset the switch, so the system prompts you to confirm whether you want to proceed.

set system enhancedbuffermode {enable | disable}

Syntax Description

enable disable	Enables or disables enhanced buffer mode.
-------------------------	---

Command Defaults

None.

Command Mode

Read-Write.

Example

This example shows how to enable enhanced buffer mode:

```
A2 (su) ->set system enhancedbuffermode enable

Changes in the enhanced buffer mode will require resetting this unit.
Are you sure you want to continue? (y/n)
```

2.1.12.9 **show time**

Use this command to display the current time of day in the system clock.

show time

Syntax Description

None.

Command Defaults

None.

Command Mode

Read-Only.

Example

This example shows how to display the current time. The output shows the day of the week, month, day, and the time of day in hours, minutes, and seconds and the year:

```
A2 (rw) ->show time  
THU SEP 05 09:21:57 2002
```

2.1.12.10 set time

Use this command to change the time of day on the system clock.

```
set time [mm/dd/yyyy] [hh:mm:ss]
```

Syntax Description

[mm/dd/yyyy]	Sets the time in:
[hh:mm:ss]	<ul style="list-style-type: none">month, day, year and/or24-hour format
At least one set of time parameters must be entered.	

Command Defaults

None.

Command Mode

Read-Write.

Example

This example shows how to set the system clock to 7:50 a.m:

```
A2 (rw) ->set time 7:50:00
```

2.1.12.11 show summertime

Use this command to display daylight savings time settings.

show summertime

Syntax Description

None.

Command Defaults

None.

Command Mode

Read-Only.

Example

This example shows how to display daylight savings time settings:

```
A2(su)->show summertime
Summertime is disabled and set to ''
Start : SUN APR 04 02:00:00 2004
End   : SUN OCT 31 02:00:00 2004
Offset: 60 minutes (1 hours 0 minutes)
Recurring: yes, starting at 2:00 of the first Sunday of April and ending at 2:00
         of the last Sunday of October
```

2.1.12.12 set summertime

Use this command to enable or disable the daylight savings time function.

set summertime {**enable** | **disable**} [*zone*]

Syntax Description

enable disable	Enables or disables the daylight savings time function.
<i>zone</i>	(Optional) Applies a name to the daylight savings time settings.

Command Defaults

If a *zone* name is not specified, none will be applied.

Command Mode

Read-Only.

Example

This example shows how to enable daylight savings time function:

```
A2 (su) -> set summertime enable
```

2.1.12.13 set summertime date

Use this command to configure specific dates to start and stop daylight savings time. These settings will be non-recurring and will have to be reset annually.

set summertime date *start_month start_date start_year start_hr_min end_month end_date end_year end_hr_min [offset_minutes]*

Syntax Description

<i>start_month</i>	Specifies the month of the year to start daylight savings time.
<i>start_date</i>	Specifies the day of the month to start daylight savings time.
<i>start_year</i>	Specifies the year to start daylight savings time.
<i>start_hr_min</i>	Specifies the time of day to start daylight savings time. Format is hh:mm.
<i>end_month</i>	Specifies the month of the year to end daylight savings time.
<i>end_date</i>	Specifies the day of the month to end daylight savings time.
<i>end_year</i>	Specifies the year to end daylight savings time.
<i>end_hr_min</i>	Specifies the time of day to end daylight savings time. Format is hh:mm.
<i>offset_minutes</i>	(Optional) Specifies the amount of time in minutes to offset daylight savings time from the non-daylight savings time system setting. Valid values are 1 - 1440 .

Command Defaults

If an *offset* is not specified, none will be applied.

Command Mode

Read-Write.

Example

This example shows how to set a daylight savings time start date of April 4, 2004 at 2 a.m. and an ending date of October 31, 2004 at 2 a.m. with an offset time of one hour:

```
A2 (su) -> set summertime date April 4 2004 02:00 October 31 2004 02:00 60
```

2.1.12.14 set summertime recurring

Use this command to configure recurring daylight savings time settings. These settings will start and stop daylight savings time at the specified day of the month and hour each year and will not have to be reset annually.

```
set summertime recurring start_week start_day start_month start_hr_min
end_week end_day end_month end_hr_min [offset_minutes]
```

Syntax Description

<i>start_week</i>	Specifies the week of the month to restart daylight savings time. Valid values are: first , second , third , fourth , and last .
<i>start_day</i>	Specifies the day of the week to restart daylight savings time.
<i>start_hr_min</i>	Specifies the time of day to restart daylight savings time. Format is hh:mm.
<i>end_week</i>	Specifies the week of the month to end daylight savings time.
<i>end_day</i>	Specifies the day of the week to end daylight savings time.
<i>end_hr_min</i>	Specifies the time of day to end daylight savings time. Format is hh:mm.
<i>offset_minutes</i>	(Optional) Specifies the amount of time in minutes to offset daylight savings time from the non-daylight savings time system setting. Valid values are 1 - 1440 .

Command Defaults

If an *offset* is not specified, none will be applied.

Command Mode

Read-Write.

Example

This example shows how set daylight savings time to recur starting the first Sunday of April at 2 a.m. and ending the last Sunday of October at 2 a.m. with an offset time of one hour:

```
A2 (su) -> set summertime recurring first Sunday April 02:00 last Sunday October
02:00 60
```

2.1.12.15 **clear summertime**

Use this command to clear the daylight savings time configuration.

clear summertime

Syntax Description

None.

Command Defaults

None.

Command Mode

Read-Write.

Example

This example shows how to clear the daylight savings time configuration:

```
A2 (su) ->clear summertime
```

2.1.12.16 set prompt

Use this command to modify the command prompt.

```
set prompt "prompt_string"
```

Syntax Description

<i>prompt_string</i>	Specifies a text string for the command prompt.
	NOTE: A prompt string containing a space in the text must be enclosed in quotes as shown in the example below.

Command Defaults

None.

Command Mode

Read-Write.

Example

This example shows how to set the command prompt to Switch 1:

```
A2(rw)->set prompt "Switch 1"
Switch 1(rw)->
```

2.1.12.17 show banner motd

Use this command to show the banner message of the day that will display at session login.

show banner motd

Syntax Description

None.

Command Defaults

None.

Command Mode

Read-Only.

Example

This example shows how to display the banner message of the day:

```
A2 (rw) -> show banner motd
O Knights of Ni, you are just and
fair, and we will return with a shrubbery
-King Arthur
```

2.1.12.18 set banner motd

Use this command to set the banner message of the day displayed at session login.

set banner motd *message*

Syntax Description

<i>message</i>	Specifies a message of the day. This is a text string that needs to be in double quotes if any spaces are used. Use a \n for a new line and \t for a tab (eight spaces).
----------------	--

Command Defaults

None.

Command Mode

Read-Write.

Example

This example shows how to set the message of the day banner to read “O Knights of Ni, you are just and fair, and we will return with a shrubbery - King Arthur”.

```
A2 (rw) -> set banner motd "O Knights of Ni, you are just and \n
fair, and we will return with a shrubbery \n \t -King Arthur"
```

2.1.12.19 clear banner motd

Use this command to clear the banner message of the day displayed at session login to a blank string.

clear banner motd

Syntax Description

None.

Command Defaults

None.

Command Mode

Read-Write.

Example

This example shows how to clear the message of the day banner to a blank string:

```
A2 (rw) ->clear banner motd
```

2.1.12.20 show version

Use this command to display hardware and firmware information. Refer to [Section 2.1.14](#) for instructions on how to download a firmware image.

show version

Syntax Description

None.

Command Defaults

None.

Command Mode

Read-Only.

Example

This example shows how to display version information:

```
A2 (rw)->show version

Copyright (c) 2005 by Enterasys Networks, Inc.

  Model          Serial #          Versions
  -----
A2H124-48        052200119001        Hw:BCM5655 REV 18
                                     Bp:01.00.33
                                     Fw:01.00.26
                                     BuFw:01.00.07

                                     Bp:01.00.33
                                     Fw:01.00.26
                                     BuFw:01.00.07

                                     PoE:290_21

A2 (su)->
```

[Table 2-6](#) provides an explanation of the command output.

Table 2-6 show version Output Details

Output	What It Displays...
Model	Switch's model number.
Serial #	Serial number of the switch.
Versions	<ul style="list-style-type: none">• Hw: Hardware version number.• Bp: BootPROM version• Fw: Current firmware version number.• BuFw: Backup firmware version number.• PoE: Power over Ethernet driver version.

2.1.12.21 set system name

Use this command to configure a name for the system.

set system name [*string*]

Syntax Description

<i>string</i>	(Optional) Specifies a text string that identifies the system.
---------------	--

NOTE: A name string containing a space in the text must be enclosed in quotes as shown in the example below.

Command Defaults

If *string* is not specified, the system name will be cleared.

Command Mode

Read-Write.

Example

This example shows how to set the system name to Information Systems:

```
A2 (rw) -> set system name "Information Systems"
```

2.1.12.22 set system location

Use this command to identify the location of the system.

```
set system location [string]
```

Syntax Description

<i>string</i>	(Optional) Specifies a text string that indicates where the system is located.
	NOTE: A location string containing a space in the text must be enclosed in quotes as shown in the example below.

Command Defaults

If *string* is not specified, the location name will be cleared.

Command Mode

Read-Write.

Example

This example shows how to set the system location string:

```
A2 (rw) ->set system location "Bldg N32-04 Closet 9"
```

2.1.12.23 set system contact

Use this command to identify a contact person for the system.

set system contact [*string*]

Syntax Description

string	(Optional) Specifies a text string that contains the name of the person to contact for system administration.
--------	---

NOTE: A contact string containing a space in the text must be enclosed in quotes as shown in the example below.

Command Defaults

If *string* is not specified, the contact name will be cleared.

Command Mode

Read-Write.

Example

This example shows how to set the system contact string:

```
A2 (rw) -> set system contact "Joe Smith"
```

2.1.12.24 set width

Use this command to set the number of columns for the terminal connected to the switch’s console port. The length of the CLI is set using the **set length** command as described in [Section 2.1.12.25](#).

set width *screenwidth* [**default**]

Syntax Description

<i>screenwidth</i>	Sets the number of terminal columns. Valid values are 50 to 150 .
default	(Optional) Makes this setting persistent for all future sessions (written to NV-RAM).

Command Defaults

None.

Command Mode

Read-Write.

Example

This example shows how to set the screen width to 150:

```
A2 (rw) -> set width 150
```

2.1.12.25 set length

Use this command to set the number of lines the CLI will display. This command is persistent (written to NV-RAM).

set length *screenlength*

Syntax Description

<i>screenlength</i>	Sets the number of lines in the CLI display. Valid values are 0 , which disables the scrolling screen feature described in Section 2.1.7.2 , and from 5 to 512 .
---------------------	---

Command Defaults

None.

Command Mode

Read-Write.

Example

This example shows how to set the terminal length to 50:

A2 (rw) ->**set length 50**

2.1.12.26 show logout

Use this command to display the time (in seconds) an idle console or Telnet CLI session will remain connected before timing out.

show logout

Syntax Description

None.

Command Defaults

None.

Command Mode

Read-Only.

Example

This example shows how to display the CLI logout setting:

```
A2 (rw) -> show logout  
Logout currently set to: 10 minutes.
```

2.1.12.27 set logout

Use this command to set the time (in minutes) an idle console or Telnet CLI session will remain connected before timing out.

set logout *timeout*

Syntax Description

<i>timeout</i>	Sets the number of minutes the system will remain idle before timing out.
----------------	---

Command Defaults

None.

Command Mode

Read-Write.

Example

This example shows how to set the system timeout to 10 minutes:

A2 (rw) ->**set logout 10**

2.1.12.28 show console

Use this command to display console settings.

show console [**baud**] [**bits**] [**flowcontrol**] [**parity**] [**stopbits**]

Syntax Description

baud	(Optional) Displays the input/output baud rate.
bits	(Optional) Displays the number of bits per character.
flowcontrol	(Optional) Displays the type of flow control.
parity	(Optional) Displays the type of parity.
stopbits	(Optional) Displays the number of stop bits.

Command Defaults

If not specified, all settings will be displayed.

Command Mode

Read-Only.

Example

This example shows how to display all console settings:

```
A2 (rw) -> show console
Baud      Flow      Bits  StopBits  Parity
-----
9600      Disable   8     1         none
```

2.1.12.29 set console baud

Use this command to set the console port baud rate.

set console baud *rate*

Syntax Description

<i>rate</i>	Sets the console baud rate. Valid values are: 300, 600, 1200, 2400, 4800, 5760, 9600, 14400, 19200, 38400, and 115200.
-------------	---

Command Defaults

None.

Command Mode

Read-Write.

Example

This example shows how to set the console port baud rate to 19200:

```
A2 (rw) -> set console baud 19200
```

2.1.13 Configuring Power over Ethernet (PoE)

Important Notice

This section applies only to PoE-equipped SecureStack switches. Consult the Installation Guide shipped with your product to determine if it is PoE-equipped.

Purpose

To review and set PoE parameters, including the power available to the unit, the usage threshold for each unit, whether or not SNMP trap messages will be sent when power status changes, and per-port PoE settings.

Commands

The commands used to review and set PoE port parameters are listed below and described in the associated section as shown.

- show inlinepower ([Section 2.1.13.1](#))
- set inlinepower threshold ([Section 2.1.13.2](#))
- set inlinepower trap ([Section 2.1.13.3](#))
- show port inlinepower ([Section 2.1.13.4](#))
- set port inlinepower ([Section 2.1.13.5](#))

2.1.13.1 show inlinepower

Use this command to display switch PoE properties.

show inlinepower

Syntax Description

None.

Command Defaults

None.

Command Mode

Read-Only.

Example

This example shows how to display switch PoE properties. In this case, only units 2, 4, and 8 are PoE units, so their power configurations display:

A2 (rw) -> show inlinepower						
Unit	Status	Power (W)	Consumption (W)	Usage (%)	Threshold (%)	Trap
----	-----	-----	-----	-----	-----	----
2	auto	360	0.00	0.00	80	enable
4	auto	360	0.00	0.00	80	enable
8	auto	360	5.20	1.44	80	enable

2.1.13.2 set inlinepower threshold

Use this command to set the PoE usage threshold on a specified unit.

set inlinepower threshold *usage-threshold module-number*

Syntax Description

<i>usage-threshold</i>	Specifies a PoE threshold as a percentage of total system power usage. Valid values are 1 - 99 .
<i>unit-number</i>	Specifies the unit on which to set the PoE threshold.

Command Defaults

None.

Command Mode

Read-Write.

Example

This example shows how to set the PoE threshold to 50% on unit 1:

```
A2 (rw) ->set inlinepower threshold 50 1
```

2.1.13.3 set inlinepower trap

Use this command to enable or disable the sending of an SNMP trap message for a unit whenever the status of its ports changes, or whenever the module’s PoE usage threshold is crossed. The unit’s PoE usage threshold must be set using the **set inlinepower threshold** command as described in [Section 2.1.13.2](#).

set inlinepower trap {disable | enable} *unit-number*

Syntax Description

disable enable	Disables or enables PoE trap messaging.
<i>unit-number</i>	Specifies the unit on which to disable or enable trap messaging.

Command Mode

Read-Write.

Example

This example shows how to enable PoE trap messaging on unit 1:

A2 (rw) ->**set inlinepower trap enable 1**

2.1.13.4 show port inlinepower

Use this command to display all ports supporting PoE.

show port inlinepower [*port-string*]

Syntax Description

<i>port-string</i>	(Optional) Displays information for specific PoE port(s).
--------------------	---

Command Defaults

If not specified, information for all PoE ports will be displayed.

Command Mode

Read-Only.

Example

This example shows how to display PoE information for Fast Ethernet ports 1 through 6 on unit 1. In this case, the ports' administrative state, PoE priority and class have not been changed from default values:

```
A2 (rw) -> show port inlinepower fe.1.1-6
```

Port	Admin	Oper	Priority	Class
-----	-----	-----	-----	-----
fe.1.1	auto	searching	low	0
fe.1.2	auto	searching	low	0
fe.1.3	auto	searching	low	0
fe.1.4	auto	searching	low	0
fe.1.5	auto	searching	low	0
fe.1.6	auto	searching	low	0

2.1.13.5 set port inlinepower

Use this command to configure PoE parameters on one or more ports.

```
set port inlinepower port-string {[admin {off | auto}] [priority {critical | high | low}]} [type type]}
```

Syntax Description

<i>port-string</i>	Specifies the port(s) on which to configure PoE.
admin off auto	Sets the PoE administrative state to off (disabled) or auto (on).
priority critical high low	Sets the port(s) priority for the PoE allocation algorithm to critical (highest), high or low.
type <i>type</i>	Specifies a string describing the type of switch connected to a port.

Command Defaults

None.

Command Mode

Read-Write.

Example

This example shows how to enable PoE on port fe.3.1 with critical priority:

A2 (rw) ->set port inlinepower fe.3.1 admin auto priority critical

2.1.14 Downloading a New Firmware Image

You can upgrade the operational firmware in the SecureStack A2 switch without physically opening the switch or being in the same location. There are two ways to download firmware to the switch:

- Via TFTP download. This procedure uses a TFTP server connected to the network and downloads the firmware using the TFTP protocol. For details on how to perform a TFTP download using the **copy** command, refer to [Section 2.1.16.7](#). For information on setting TFTP timeout and retry parameters used by the switch, refer to [Section 2.1.16.10](#) and [Section 2.1.16.12](#).
- Via the serial (console) port. This procedure is an out-of-band operation that copies the firmware through the serial port to the switch. It should be used in cases when you cannot connect the switch to perform the in-band **copy** download procedure via TFTP. Serial console download has been successfully tested with the following applications:
 - HyperTerminal Copyright 1999
 - Tera Term Pro Version 2.3

Any other terminal applications may work but are not explicitly supported.

2.1.14.1 Downloading from a TFTP Server

To perform a TFTP download, proceed as follows:

1. If you have not already done so, set the switch's IP address using the **set ip address** command as detailed in [Section 2.1.12.3](#).
2. Download a new image file using the **copy** command as detailed in [Section 2.1.16.7](#).

2.1.14.2 Downloading via the Serial Port

To download switch firmware via the serial (console) port, proceed as follows:

1. With the console port connected, power up the switch. The following message displays:

```
Enterasys A2-Series Boot Code...
SDRAM Circuit Test of 256MB
100%

Version 1.0.13 6/14/2004

Computing MD5 Checksum of operational code...
Select an option. If no selection in 2 seconds then
operational code will start.

1 - Start operational code.
2 - Start Boot Menu.
Select (1, 2):2

Password: *****
```

2. Before the boot up completes, type **2** to select “Start Boot Menu”. Use “administrator” for the Password.

NOTE: The above “Boot Menu” password “administrator” can be changed using boot menu option 10.

3. The following boot menu options screen displays.

```
Boot Menu Version 01.00.33 08-03-2005

Options available
1 - Start operational code
2 - Change baud rate
3 - Retrieve event log using XMODEM (64KB).
4 - Load new operational code using XMODEM
5 - Display operational code vital product data
6 - Update Boot Code
7 - Delete operational code
8 - Reset the system
9 - Restore Configuration to factory defaults (delete config files)
10 - Set new Boot Code password
[Boot Menu] 2
```

4. Type 2. The following baud rate selection screen displays:

```
1 - 1200
2 - 2400
3 - 4800
4 - 9600
5 - 19200
6 - 38400
7 - 57600
8 - 115200
0 - no change
```

5. Type 8 to set the switch baud rate to 115200. The following message displays:

```
Setting baud rate to 115200, you must change your terminal baud rate.
```

6. Set the terminal baud rate to **115200** and press ENTER.

Downloading a New Firmware Image

7. From the boot menu options screen, type **4** to load new operational code using XMODEM.
When the XMODEM transfer is complete, the following message and header information will display:

```
[Boot Menu] 4
Ready to receive the file with XMODEM/CRC....
Ready to RECEIVE File xcode.bin in binary mode
Send several Control-X characters to cCKcKcKcKcKcKcK

XMODEM transfer complete, checking CRC....
Verified operational code CRC.
```

The following Enterasys Header is in the image:

```
MD5 Checksum.....fe967970996c4c8c43a10cd1cd7be99a
Boot File Identifier.....0x0517
Header Version.....0x0100
Image Type.....0x82
Image Offset.....0x004d
Image length.....0x006053b3
Ident Strings Length.....0x0028
Ident Strings.....
A2H124-24
A2H124-48
A2H124-48

Image Version Length.....0x7
Image Version Bytes.....0x30 0x2e 0x35 0x2e 0x30 0x2e 0x34 (0.5.0.4)
```

8. From the boot menu options screen, type **2** to display the baud rate selection screen again.
9. Type **4** set the switch baud rate to **9600**. The following message displays:

```
Setting baud rate to 9600, you must change your terminal baud rate.
```

10. Set the terminal baud rate to **9600** and press ENTER.

11. From the boot menu options screen, type **1** to start the new operational code. The following message displays:

```
Operational Code Date: Tue Jun 29 08:34:05 2004
Uncompressing.....
```

2.1.14.3 **show boot system**

Use this command to display the firmware image the switch loads at startup.

show boot system

Syntax Description

None.

Command Defaults

None.

Command Mode

Read-Only.

Example

This example shows how to display the switch's boot firmware image:

```
A2(su)->show boot system  
Current system image to boot: bootfile
```

2.1.14.4 set boot system

Use this command to set the firmware image the switch loads at startup.

set boot system *filename*

Syntax Description

<i>filename</i>	Specifies the name of the firmware image file.
-----------------	--

Command Defaults

None.

Command Mode

Read-Write.

Example

This example shows how to set the boot firmware image file to “newimage”:

```
A2 (su) -> set boot system newimage
```

2.1.15 Starting and Configuring Telnet

Purpose

To enable or disable Telnet.

Commands

The commands used to enable, start and configure Telnet are listed below and described in the associated section as shown.

- show telnet ([Section 2.1.15.1](#))
- set telnet ([Section 2.1.15.2](#))
- telnet ([Section 2.1.15.3](#))

2.1.15.1 show telnet

Use this command to display the status of Telnet on the switch.

show telnet

Syntax Description

None.

Command Defaults

None.

Command Mode

Read-only.

Example

This example shows how to display Telnet status:

```
A2 (rw) -> show telnet  
Telnet inbound is currently: ENABLED  
Telnet outbound is currently: ENABLED
```

2.1.15.2 set telnet

Use this command to enable or disable Telnet on the switch.

set telnet {**enable** | **disable**} [**inbound** | **outbound** | **all**]

Syntax Description

enable disable	Enables or disables Telnet services.
inbound outbound all	(Optional) Specifies inbound service (the ability to Telnet to this switch), outbound service (the ability to Telnet to other devices), or all (both inbound and outbound).

Command Defaults

If not specified, both inbound and outbound Telnet service will be enabled or disabled.

Command Mode

Read-Write.

Example

This example shows how to disable inbound and outbound Telnet services:

```
A2(rw)->set telnet disable all
Disconnect all telnet sessions and disable now (y/n)? [n]: y
All telnet sessions have been terminated, telnet is now disabled.
```

2.1.15.3 telnet

Use this command to start a Telnet connection to a remote host. The SecureStack A2 switch allows a total of four inbound and / or outbound Telnet session to run simultaneously.

telnet *host* [*port*]

Syntax Description

<i>host</i>	Specifies the name or IP address of the remote host.
<i>port</i>	(Optional) Specifies the server port number.

Command Defaults

If not specified, the default *port* number 23 will be used.

Command Mode

Read-Write.

Example

This example shows how to start a Telnet session to a host at 10.21.42.13:

```
A2 (su) ->telnet 10.21.42.13
```

2.1.16 Managing Switch Configuration and Image Files

Configuration Persistence Mode

The default state of configuration persistence mode is “auto,” which means that when CLI configuration commands are entered, or when a configuration file stored on the switch is executed, the configuration is saved to NVRAM automatically at the following intervals:

- On a stand-alone unit, the configuration is checked every two minutes and saved if there has been a change.
- On a stack, the configuration is saved across the stack every 30 minutes if there has been a change.

If you want to save a running configuration to NVRAM more often than the automatic intervals, execute the **save config** command and wait for the system prompt to return. After the prompt returns, the configuration will be persistent.

You can change the persistence mode from “auto” to “manual” with the **set snmp persistmode** command. If the persistence mode is set to “manual,” configuration commands will not be automatically written to NVRAM. Although the configuration commands will actively modify the running configuration, they will not persist across a reset unless the **save config** command has been executed.

Purpose

To set and view the persistence mode for CLI configuration commands, manually save the running configuration, view, manage, and execute configuration files and image files, and set and view TFTP parameters.

Commands

- show snmp persistmode ([Section 2.1.16.1](#))
- set snmp persistmode ([Section 2.1.16.2](#))
- save config ([Section 2.1.16.3](#))
- dir ([Section 2.1.16.4](#))
- show config ([Section 2.1.16.5](#))
- configure ([Section 2.1.16.6](#))
- copy ([Section 2.1.16.7](#))
- delete ([Section 2.1.16.8](#))
- show tftp settings ([Section 2.1.16.9](#))

- set tftp timeout ([Section 2.1.16.10](#))
- clear tftp timeout ([Section 2.1.16.11](#))
- set tftp retry ([Section 2.1.16.12](#))
- clear tftp retry ([Section 2.1.16.13](#))

2.1.16.1 show snmp persistmode

Use this command to display the configuration persistence mode setting. By default, the mode is set to “auto save,” which automatically saves configuration changes at specific intervals. If the mode is set to “manual,” configuration commands are never automatically saved. In order to make configuration changes persistent when the mode is manual, the **save config** command must be issued as described in [Section 2.1.16.3](#).

show snmp persistmode

Syntax Description

None.

Command Defaults

None.

Command Mode

Read-Only.

Example

This example shows how to display the configuration persistence mode setting. In this case, persistence mode is set to “manual”, which means configuration changes are not being automatically saved.

```
A2 (su) -> show snmp persistmode
persistmode is manual
```

2.1.16.2 set snmp persistmode

Use this command to set the configuration persistence mode, which determines whether user-defined configuration changes are saved automatically, or require issuing the **save config** command. See “[Configuration Persistence Mode](#)” on page 2-97 for more information.

set snmp persistmode {auto | manual}

Syntax Description

auto	Sets the configuration persistence mode to automatic.
manual	Sets the configuration persistence mode to manual. In order to make configuration changes persistent, the save config command must be issued as described in Section 2.1.16.3 . This mode is useful for reverting back to old configurations.

Command Defaults

None.

Command Mode

Read-Write.

Example

This example shows how to set the configuration persistence mode to manual:

```
A2 (su) -> set snmp persistmode manual
```

2.1.16.3 **save config**

Use this command to save the running configuration on all switch members in a stack.

save config

Syntax Description

None.

Command Defaults

None.

Command Mode

Read-Write.

Example

This example shows how to save the running configuration on all switch members in a stack:

```
A2 (su) ->save config
```

2.1.16.4 dir

Use this command to list configuration files stored in the file system.

dir [*filename*]

Syntax Description

<i>filename</i>	(Optional) Specifies the file name or directory to list.
-----------------	--

Command Mode

Read-Only.

Command Defaults

If *filename* is not specified, all files in the system will be displayed.

Example

This example shows how to list all the configuration files in the system:

```
A2 (rw) ->dir

Files:                                     Size
=====
configs:
Jan1_2004.cfg                             1125
```

2.1.16.5 show config

Use this command to display the system configuration or write the configuration to a file.

show config [**all** | *facility*] [**outfile** {**configs/filename**}]

Syntax Description

all	(Optional) Displays default and non-default configuration settings.
<i>facility</i>	Exact name of one facility for which to show configuration, 'router' to show router only configuration.
outfile	Specifies that the current configuration will be written to a text file in the configs/ directory.
configs/filename	Specifies a filename in the configs/ directory to display.

Command Mode

Read-Only.

Command Defaults

By default **show config** will display all non-default configuration information for all facilities.

Examples

This example shows how to write the current configuration to a file named save_config2:

```
A2 (rw) -> show config outfile configs/save_config2
```

This example shows how to display switch configuration for the facility 'port':

```
A2 (rw) -> show config port  
  
#port  
set port jumbo disable fe.1.1  
  
!  
end
```

This example shows how to display the current non-default switch configuration:

```
A2 (rw) -> show config
!
#***** NON-DEFAULT CONFIGURATION *****
#console
!
#diffserv
!
#eapol
!
#flowlimit
!
#garp
!
#gvrp
!
#igmp
!
#ip
set ip protocol dhcp
!
#length
!
#logout
!
#mac
!
#mtu
set port jumbo enable fe.3.14
!
```

2.1.16.6 configure

Use this command to execute a previously downloaded configuration file stored on the switch.

configure *filename* [**append**]

Syntax Description

<i>filename</i>	Specifies the path and file name of the configuration file to execute.
append	(Optional) Executes the configuration as an appendage to the current configuration. This is equivalent to typing the contents of the config file directly into the CLI and can be used, for example, to make incremental adjustments to the current configuration.

Command Mode

Read-Write.

Command Defaults

If **append** is not specified, the current running configuration will be replaced with the contents of the configuration file, which will require an automated reset of the unit.

Example

This example shows how to execute the “Jan1_2004.cfg” configuration file:

```
A2 (rw) -> configure configs/Jan1_2004.cfg
```

2.1.16.7 copy

Use this command to upload or download an image or a CLI configuration file.

copy *source destination*

Syntax Description

<i>source</i>	Specifies location and name of the source file to copy. Options are a local file path in the configs directory, or the URL of a TFTP server.
<i>destination</i>	Specifies location and name of the destination where the file will be copied. Options are a slot location and file name, or the URL of a TFTP server.

Command Mode

Read-Write.

Command Defaults

None.

Examples

This example shows how to download an image via TFTP:

```
A2 (rw) ->copy tftp://10.1.89.34/version01000 system:image
```

This example shows how to download a configuration file to the directory structure:

```
A2 (su) ->copy tftp://10.1.192.1/Jan1_2004.cfg configs/Jan1_2004.cfg
```

This example shows how to copy a configuration from the switch to a TFTP server:

```
A2 (su) ->copy configs/example.cfg tftp://10.1.192.1/example.cfg
```

2.1.16.8 delete

Use this command to remove an image or a CLI configuration file from the SecureStack system.

delete *filename*

NOTE: Use the **show config** command as described in [Section 2.1.16.5](#) to display current image and configuration file names.

Syntax Description

<i>filename</i>	Specifies the local path name to the file. Valid directories are /images and /slotN.
-----------------	--

Command Mode

Read-Write.

Command Defaults

None.

Example

This example shows how to delete the “Jan1_2004.cfg” configuration file:

```
A2 (rw) ->delete configs/Jan1_2004.cfg
```

2.1.16.9 show tftp settings

Use this command to display TFTP settings used by the switch during data transfers using TFTP. The TFTP timeout value can be set with the **set tftp timeout** command. The TFTP retry value can be set with the **set tftp retry** command.

show tftp settings

Syntax Description

None.

Command Mode

Read-Only.

Command Defaults

None.

Example

This example shows the output of this command.

```
A2(ro)->show tftp settings
TFTP packet timeout (seconds): 2
TFTP max retry: 5
```

2.1.16.10 set tftp timeout

Use this command to configure how long TFTP will wait for a reply of either an acknowledgement packet or a data packet during a data transfer.

set tftp timeout *seconds*

Syntax Description

<i>seconds</i>	Specifies the number of seconds to wait for a reply. The valid range is from 1 to 30 seconds. Default value is 2 seconds.
----------------	---

Command Mode

Read-Write.

Command Defaults

None.

Example

This example sets the timeout period to 4 seconds.

```
A2(rw)->set tftp timeout 4
```

2.1.16.11 clear tftp timeout

Use this command to reset the TFTP timeout value to the default value of 2 seconds.

clear tftp timeout

Syntax Description

None.

Command Mode

Read-Write.

Command Defaults

None.

Example

This example shows how to clear the timeout value to the default of 2 seconds.

```
A2 (rw) -> clear tftp timeout
```

2.1.16.12 set tftp retry

Use this command to configure how many times TFTP will resend a packet, either an acknowledgement packet or a data packet.

set tftp retry *retry*

Syntax Description

<i>retry</i>	Specifies the number of times a packet will be resent. The valid range is from 1 to 1000. Default value is 5 retries.
--------------	---

Command Mode

Read-Write.

Command Defaults

None.

Example

This example sets the retry count to 3.

```
A2(rw)->set tftp retry 3
```

2.1.16.13 clear tftp retry

Use this command to reset the TFTP retry value to the default value of 5 retries.

clear tftp retry

Syntax Description

None.

Command Mode

Read-Write.

Command Defaults

None.

Example

This example shows how to clear the retry value to the default of 5 retries.

```
A2 (rw) -> clear tftp retry
```

2.1.17 Configuring CDP

Purpose

To review and configure the CDP discovery protocol.

Commands

The commands used to review and configure the CDP discovery protocol are listed below and described in the associated section as shown.

- show cdp ([Section 2.1.17.1](#))
- set cdp state ([Section 2.1.17.2](#))
- set cdp auth ([Section 2.1.17.3](#))
- set cdp interval ([Section 2.1.17.4](#))
- set cdp hold-time ([Section 2.1.17.5](#))
- clear cdp ([Section 2.1.17.6](#))

2.1.17.1 show cdp

Use this command to display the status of the CDP discovery protocol and message interval on one or more ports.

```
show cdp [port-string]
```

Syntax Description

<i>port-string</i>	(Optional) Displays CDP status for a specific port. For a detailed description of possible port-string values, refer to Section 3.1.1 .
--------------------	---

Command Defaults

If *port-string* is not specified, CDP information for all ports will be displayed.

Command Mode

Read-Only.

Example

This example shows how to display CDP information for ports fe.1.1 through fe.1.9:

```
A2 (rw) ->show cdp fe.1.1-9
Port      Status
-----
fe.1.1    auto-enable
fe.1.2    auto-enable
fe.1.3    auto-enable
fe.1.4    auto-enable
fe.1.5    auto-enable
fe.1.6    auto-enable
fe.1.7    auto-enable
fe.1.8    auto-enable
fe.1.9    auto-enable
```

[Table 2-7](#) provides an explanation of the command output.

Table 2-7 show cdp Output Details

Output	What It Displays...
CDP Global Status	Whether CDP is globally auto-enabled, enabled or disabled. The default state of auto-enabled can be reset with the set cdp state command. For details, refer to Section 2.1.17.2 .
CDP Versions Supported	CDP version number(s) supported by the switch.
CDP Hold Time	Minimum time interval (in seconds) at which CDP configuration messages can be set. The default of 180 seconds can be reset with the set cdp hold-time command. For details, refer to Section 2.1.17.5 .
CDP Authentication Code	Authentication code for CDP discovery protocol. The default of 00-00-00-00-00-00-00-00 can be reset using the set cdp auth command. For details, refer to Section 2.1.17.3 .
CDP Transmit Frequency	Frequency (in seconds) at which CDP messages can be transmitted. The default of 60 seconds can be reset with the set cdp interval command. For details, refer to Section 2.1.17.4 .
Port	Port designation. For a detailed description of possible <i>port-string</i> values, refer to Section 3.1.1 .
Status	Whether CDP is enabled, disabled or auto-enabled on the port.

2.1.17.2 set cdp state

Use this command to enable or disable the CDP discovery protocol on one or more ports.

```
set cdp state {auto | disable | enable} [port-string]
```

Syntax Description

auto disable enable	Auto-enables, disables or enables the CDP protocol on the specified port(s). In auto-enable mode, which is the default mode for all ports, a port automatically becomes CDP-enabled upon receiving its first CDP message.
<i>port-string</i>	(Optional) Enables or disables CDP on specific port(s). For a detailed description of possible <i>port-string</i> values, refer to Section 3.1.1

Command Defaults

If *port-string* is not specified, the CDP state will be globally set.

Command Mode

Read-Write.

Examples

This example shows how to globally enable CDP:

```
A2 (rw) ->set cdp state enable
```

This example shows how to enable the CDP for port fe.1.2:

```
A2 (rw) ->set cdp state enable fe.1.2
```

This example shows how to disable the CDP for port fe.1.2:

```
A2 (rw) ->set cdp state disable fe.1.2
```

2.1.17.3 set cdp auth

Use this command to set a global CDP authentication code. This value determines a device’s CDP domain. If two or more devices have the same CDP authentication code, they will be entered into each other's CDP neighbor tables. If they have different authentication codes, they are in different domains and will not be entered into each other’s CDP neighbor tables.

A device with the default authentication code (16 null characters) will recognize all devices, no matter what their authentication code, and enter them into its CDP neighbor table.

set cdp auth *auth-code*

Syntax Description

<i>auth-code</i>	Specifies an authentication code for the CDP protocol. This can be up to 16 hexadecimal values separated by commas.
------------------	---

Command Defaults

None.

Command Mode

Read-Write.

Example

This example shows how to set the CDP authentication code to 1,2,3,4,5,6,7,8:

```
A2 (rw) ->set cdp auth 1,2,3,4,5,6,7,8
```

2.1.17.4 set cdp interval

Use this command to set the message interval frequency (in seconds) of the CDP discovery protocol.

set cdp interval *frequency*

Syntax Description

<i>frequency</i>	Specifies the transmit frequency of CDP messages in seconds. Valid values are from 5 to 900 seconds.
------------------	--

Command Defaults

None.

Command Mode

Read-Write.

Example

This example shows how to set the CDP interval frequency to 15 seconds:

A2 (rw) ->**set cdp interval 15**

2.1.17.5 set cdp hold-time

Use this command to set the hold time value for CDP discovery protocol configuration messages.

set cdp hold-time *hold-time*

Syntax Description

<i>hold-time</i>	Specifies the hold time value for CDP messages in seconds. Valid values are from 15 to 600 .
------------------	---

Command Defaults

None.

Command Mode

Read-Write.

Example

This example shows how to set CDP hold time to 60 seconds:

```
A2 (rw) ->set cdp hold-time 60
```

2.1.17.6 clear cdp

Use this command to reset CDP discovery protocol settings to defaults.

```
clear cdp {[state] [port-state port-string] [interval] [hold-time] [auth-code]}
```

Syntax Description

state	(Optional) Resets the global CDP state to auto-enabled.
port-state port-string	(Optional) Resets the port state on specific port(s) to auto-enabled.
interval	(Optional) Resets the message frequency interval to 60 seconds.
hold-time	(Optional) Resets the hold time value to 180 seconds.
auth-code	(Optional) Resets the authentication code to 16 bytes of 00 (00-00-00-00-00-00-00-00).

Command Defaults

At least one optional parameter must be entered.

Command Mode

Read-Write.

Example

This example shows how to reset the CDP state to auto-enabled:

```
A2 (rw) ->clear cdp state
```

2.1.18 Clearing and Closing the CLI

Purpose

To clear the CLI screen or to close your CLI session.

Commands

The commands used to clear and close the CLI session are listed below and described in the associated sections as shown.

- `cls` ([Section 2.1.18.1](#))
- `exit` ([Section 2.1.18.2](#))

2.1.18.1 **cls (clear screen)**

Use this command to clear the screen for the current CLI session.

cls

Syntax Description

None.

Command Defaults

None.

Command Mode

Read-Only.

Example

This example shows how to clear the CLI screen:

```
A2 (rw) ->cls
```

2.1.18.2 **exit**

Use this command to leave a CLI session.

exit

NOTE: By default, switch timeout occurs after 15 minutes of user inactivity, automatically closing your CLI session. Use the **set logout** command as described in [Section 2.1.12.27](#) to change this default.

Syntax Description

None.

Command Defaults

None.

Command Mode

Read-Only.

Example

This example shows how to exit a CLI session:

```
A2 (rw) ->exit
```

2.1.19 Resetting the Switch

Purpose

To reset one or more units, and to clear the user-defined configuration parameters.

Commands

The commands used to reset the switch and clear the configuration are listed below and described in the associated sections as shown.

- reset ([Section 2.1.19.1](#))
- clear config ([Section 2.1.19.2](#))

2.1.19.1 reset

Use this command to reset the switch without losing any user-defined configuration settings, or to display information about switch resets.

reset [*unit*]

NOTE: The reset button located on the front panel of a SecureStack A2 switch is used to reset administratively set passwords only. Pushing the reset button will not cause the unit to reboot. For information on how to reboot the unit, refer to the *SecureStack A2 Installation Guide* shipped with your switch.

Syntax Description

<i>unit</i>	(Optional) Specifies a unit to be reset.
-------------	--

Command Defaults

If no *unit* ID is specified, the entire system will be reset.

Command Mode

Read-Write.

Examples

This example shows how to reset the system:

```
A2(su)->reset
Are you sure you want to reload the stack? (y/n) y

Saving Configuration to stacking members
Reloading all switches.
```

This example shows how to reset unit 1 in the stack:

```
A2(su)->reset 1
Are you sure you want to reload the switch? (y/n) y

Reloading switch 1.
This switch is manager of the stack.
STACK: detach 3 units
```

2.1.19.2 clear config

Use this command to clear the user-defined configuration parameters.

clear config [all]

NOTES: The switch's IP address will be retained when running the **clear config** or the **clear config all** command.

To clear the IP address on the SecureStack use the **set ip protocol none** command.

When using the **clear config** command to clear configuration parameters in a stack, it is important to remember the following:

- Use **clear config** to clear config parameters without clearing stack unit IDs. This command WILL NOT clear stack parameters and avoids the process of re-numbering the stack.
- Use **clear config all** when it is necessary to clear all config parameters, including stack unit IDs and switch priority values.

Configuration parameters and stacking information can also be cleared **on the master unit only** by selecting option 10 (restore configuration to factory defaults) from the boot menu on switch startup. This selection will leave stacking priorities on all other units.

When an A2 standalone switch has the front panel uplink ports configured in Ethernet mode, **clear config** will not change the uplink ports to Stacking mode. The **clear config all** command will set the uplink ports to Stacking mode. Refer to the **set switch stack-ports** command, [Section 2.1.10.1](#), for more information.

Syntax Description

all	(Optional) Clears user-defined configuration parameters and stack unit numbers and priorities.
------------	--

Command Defaults

If **all** is not specified, stacking configuration parameters will not be cleared.

Command Mode

Read-Write.

Example

This example shows how to clear configuration parameters, including stacking parameters:

```
A2 (su) ->clear config all
```

Port Configuration

This chapter describes the Port Configuration set of commands and how to use them.

Important Notice

CLI examples in this guide illustrate a generic command prompt. Depending on which device you are using, your default command prompt and output may be different than the examples shown.

3.1 PORT CONFIGURATION SUMMARY

A2H124-24 and A2H124-24P Switch Ports

The A2H124-24 and A2H124-24P stackable devices provide the following types of switch port connections:

- 24 RJ45 10/100 Mbps Fast Ethernet copper ports.
- 2 SFP slots (labeled port 27 and 28) that provide the option of installing Small Form Pluggable (SFP) Mini-GBICs for 1000BASE-T compliant copper connections or 1000BASE-SX\LX fiber-optic connections.
- 2 1000BASE-T RJ45 connectors (labeled port 25 and 26) that can be used for stack connections when the switch is operating in a stack configuration, or as standard switch ports when the switch is operating as a stand alone device.

A2H124-48 and A2H124-48P Switch Ports

The A2H124-48 and A2H124-48P stackable devices provide the following types of switch port connections:

- 48 RJ45 10/100 Mbps Fast Ethernet copper ports.

- 2 SFP slots (labeled port 51 and 52) that provide the option of installing Small Form Pluggable (SFP) Mini-GBICs for 1000BASE-T compliant copper connections or 1000BASE-SX\LX fiber-optic connections.
- 2 1000BASE-T RJ45 connectors (labeled port 49 and 50) that can be used for stack connections when the switch is operating in a stack configuration, or as standard switch ports when the switch is operating as a stand alone device.

A2H124-24FX Switch Ports

The A2H124-24FX stackable device provides the following types of switch port connections:

- 24 100BASE-FX multimode MT-RJ fiber optic ports.
- 2 SFP slots (labeled port 27 and 28) that provide the option of installing Small Form Pluggable (SFP) Mini-GBICs for 1000BASE-T compliant copper connections or 1000BASE-SX\LX fiber-optic connections.
- 2 1000BASE-T RJ45 connectors (labeled port 25 and 26) that can be used for stack connections when the switch is operating in a stack configuration, or as standard switch ports when the switch is operating as a stand alone device.

A2H254-16 Switch Ports

The A2H124-16 stackable device provides the following types of switch port connections:

- 8 100BASE-T 10/100 Mbps copper RJ45 ports (odd numbered 1 – 15).
- 8 100BASE-FX multimode MT-RJ ports (even numbered 2 – 16).
- 2 SFP slots (labeled port 19 and 20) that provide the option of installing Small Form Pluggable (SFP) Mini-GBICs for 1000BASE-T compliant copper connections or 1000BASE-SX\LX fiber-optic connections.
- 2 1000BASE-T RJ45 connectors (labeled port 17 and 18) that can be used for stack connections when the switch is operating in a stack configuration, or as standard switch ports when the switch is operating as a stand alone device.

3.1.1 Port String Syntax Used in the CLI

Commands requiring a *port-string* parameter use the following syntax to designate port type, unit number, and port number:

port type.unit number.port number

Where **port type** can be:

fe for 100-Mbps Ethernet

ge for 1-Gbps Ethernet

com for COM (console) port

host for the host port

lag for IEEE802.3 link aggregation ports

Unit number can be:

1 - 8 for switch units in an A2 stack

Port number can be:

1 – 52 for the A2H124-48 and A2H124-48P

1 – 28 for the A2H124-24, A2H124-24P, and A2H124-24FX

1 – 20 for the A2H254-16

The highest valid port number is dependent on the number of ports in the device and the port type.

Examples

NOTE: You can use a wildcard (*) to indicate all of an item. For example, `fe.3.*` would represent all 100Mbps Ethernet (fe) ports on unit in 3 in the stack.

This example shows the *port-string* syntax for specifying the 100-Mbps Ethernet ports 1 through 10 in unit 1 in the stack.

```
fe.1.1-10
```

This example shows the *port-string* syntax for specifying all ports (of any interface type) in all units in the stack.

```
*.*.*
```

3.2 PROCESS OVERVIEW: PORT CONFIGURATION

Use the following steps as a guide to configuring switch ports on the device:

1. Reviewing port status ([Section 3.3.1](#))
2. Disabling / Enabling and Naming ports ([Section 3.3.2](#))
3. Setting switch port speed and duplex mode ([Section 3.3.3](#))
4. Enabling / Disabling jumbo frame support ([Section 3.3.4](#))
5. Setting auto negotiation ([Section 3.3.5](#))
6. Setting flow control ([Section 3.3.6](#))
7. Setting port traps ([Section 3.3.7](#))
8. Configuring broadcast suppression ([Section 3.3.8](#))
9. Setting port mirroring ([Section 3.4](#))
10. Configuring link aggregation ([Section 3.5](#))
11. Configuring protected ports ([Section 3.6](#))

3.3 PORT CONFIGURATION COMMAND SET

3.3.1 Reviewing Port Status

Purpose

To display operating status, duplex mode, speed, port type, and statistical information about traffic received and transmitted through one or all switch ports on the device.

Commands

The commands used to review port status are listed below and described in the associated sections as shown.

- show port ([Section 3.3.1.1](#))
- show port status ([Section 3.3.1.2](#))
- show port counters ([Section 3.3.1.3](#))

3.3.1.1 show port

Use this command to display whether or not one or more ports are enabled for switching.

show port [*port-string*]

Syntax Description

<i>port-string</i>	(Optional) Displays operational status for specific port(s). For a detailed description of possible <i>port-string</i> values, refer to Section 3.1.1 .
--------------------	--

Command Defaults

If *port-string* is not specified, operational status information for all ports will be displayed.

Command Mode

Read-Only.

Example

This example shows how to display operational status information for fe.3.14:

```
A2 (rw) -> show port fe.3.14  
Port fe.3.14 enabled
```

NOTE: On the A2H256-16, switch ports 19 and 20 are shown as ports 17 and 18. On the A2H124-24FX, switch ports 27 and 28 are shown as ports 25 and 26.

3.3.1.2 show port status

Use this command to display operating and admin status, speed, duplex mode and port type for one or more ports on the device.

show port status [*port-string*]

Syntax Description

<i>port-string</i>	(Optional) Displays status for specific port(s). For a detailed description of possible <i>port-string</i> values, refer to Section 3.1.1 .
--------------------	---

Command Defaults

If *port-string* is not specified, status information for all ports will be displayed.

Command Mode

Read-Only.

Example

This example shows how to display status information for fe.3.1 through 4:

A2 (rw) -> show port status fe.3.1-4						
Port	Alias (truncated)	Oper Status	Admin Status	Speed	Duplex	Type
-----	-----	-----	-----	-----	-----	-----
fe.3.14		up	up	100.0M	full	10 t

[Table 3-1](#) provides an explanation of the command output.

Table 3-1 show port status Output Details

Output	What It Displays...
Port	Port designation. For a detailed description of possible <i>port-string</i> values, refer to Section 3.1.1 .
Oper Status	Operating status (up or down).
Admin Status	Whether the specified port is enabled (up) or disabled (down). For details on using the set port disable command to change the default port status of enabled, refer to Section 3.3.2.1 . For details on using the set port enable command to re-enable ports, refer to Section 3.3.2.2 .

Table 3-1 show port status Output Details (Continued)

Output	What It Displays...
Speed	Operational speed in Mbps or Kbps of the specified port. For details on using the set port speed command to change defaults, refer to Section 3.3.3.2 .
Duplex	Duplex mode (half or full) of the specified port. For details on using the set port duplex command to change defaults, refer to Section 3.3.5 .
Type	Physical port and interface type.

NOTE: The front panel Stacking Ports will only be displayed with the **show port status** command when they are in Ethernet mode. For information on configuring front panel stack ports refer to [Section 2.1.10.1](#).

3.3.1.3 show port counters

Use this command to display port counter statistics detailing traffic through the device and through all MIB2 network devices.

show port counters [*port-string*] [**switch** | **mib2**]

Syntax Description

<i>port-string</i>	(Optional) Displays counter statistics for specific port(s). For a detailed description of possible <i>port-string</i> values, refer to Section 3.1.1 .
switch mib2	(Optional) Displays switch or MIB2 statistics. Switch statistics detail performance of the switch device. MIB2 interface statistics detail performance of all network devices.

Command Defaults

- If *port-string* is not specified, counter statistics will be displayed for all ports.
- If **mib2** or **switch** are not specified, all counter statistics will be displayed for the specified port(s).

Command Mode

Read-Only.

Examples

This example shows how to display all counter statistics, including MIB2 network traffic and traffic through the device for fe.3.1:

```
A2 (rw)->show port counters fe.3.1

Port: fe.3.1   MIB2 Interface: 1   Bridge Port: 2
No counter discontinuity time

-----

MIB2 Interface Counters
-----
In Octets                      0
In Unicast Pkts                0
In Multicast Pkts              0
In Broadcast Pkts              0
In Discards                    0
In Errors                      0
In Unknown Protocol            0
Out Octets                     0
Out Unicasts Pkts              0
Out Multicast Pkts             0
Out Broadcast Pkts             0
Out Errors                     0

802.1Q Switch Counters
-----
Frames Received                 0
Frames Transmitted              0
```

This example shows how to display all fe.3.1 port counter statistics related to traffic through the device.

```
A2 (rw)->show port counters fe.3.1 switch

Port: fe.3.1   Bridge Port: 2
No counter discontinuity time
802.1Q Switch Counters
-----
Frames Received                 0
Frames Transmitted              0
```

Table 3-2 provides an explanation of the command output.

Table 3-2 show port counters Output Details

Output	What It Displays...
Port	Port designation. For a detailed description of possible <i>port-string</i> values, refer to Section 3.1.1 .
MIB2 Interface	MIB2 interface designation.
Bridge Port	IEEE 802.1D bridge port designation.
MIB2 Interface Counters	MIB2 network traffic counts.
802.1Q Switch Counters	Counts of frames received, transmitted, and filtered.

3.3.2 Disabling / Enabling Ports

Purpose

To disable and re-enable one or more ports. By default, all ports are enabled at device startup. You may want to disable ports for security or to troubleshoot network issues. Ports may also be assigned an alias for convenience.

Commands

The commands used enable, disable, and name ports are listed below and described in the associated section as shown.

- set port disable ([Section 3.3.2.1](#))
- set port enable ([Section 3.3.2.2](#))
- show port alias ([Section 3.3.2.3](#))
- set port alias ([Section 3.3.2.4](#))

3.3.2.1 set port disable

Use this command to administratively disable one or more ports.

set port disable *port-string*

Syntax Description

<i>port-string</i>	Specifies the port(s) to disable. For a detailed description of possible <i>port-string</i> values, refer to Section 3.1.1 .
--------------------	--

Command Defaults

None.

Command Mode

Read-Write.

Example

This example shows how to disable fe.1.1:

```
A2 (rw) -> set port disable fe.1.1
```

3.3.2.2 set port enable

Use this command to administratively enable one or more ports.

set port enable *port-string*

Syntax Description

<i>port-string</i>	Specifies the port(s) to enable. For a detailed description of possible <i>port-string</i> values, refer to Section 3.1.1 .
--------------------	---

Command Defaults

None.

Command Mode

Read-Write.

Example

This example shows how to enable fe.1.3:

A2 (rw) ->**set port enable fe.1.3**

3.3.2.3 show port alias

Use this command to display the alias name for one or more ports.

show port alias [*port-string*]

Syntax Description

<i>port-string</i>	(Optional) Displays alias name(s) for specific port(s). For a detailed description of possible <i>port-string</i> values, refer to Section 3.1.1 .
--------------------	--

Command Defaults

If *port-string* is not specified, aliases for all ports will be displayed.

Command Mode

Read-Only.

Example

This example shows how to display alias information for ports 1-3 on unit 3:

```
A2 (rw) ->show port alias fe.3.1-3
Port  fe.3.1 user
Port  fe.3.2 user
Port  fe.3.3 Admin
```

3.3.2.4 set port alias

Use this command to assign an alias name to a port.

```
set port alias port-string [name]
```

Syntax Description

<i>port-string</i>	Specifies the port to which an alias will be assigned. For a detailed description of possible <i>port-string</i> values, refer to Section 3.1.1 .
<i>name</i>	(Optional) Assigns an alias name to the port. If the alias name contains spaces, the text string must be surrounded by double quotes. Maximum length is 60 characters.

Command Defaults

If *name* is not specified, the alias assigned to the port will be cleared.

Command Mode

Read-Write.

Examples

This example shows how to assign the alias “Admin” to fe.3.3:

```
A2 (rw) ->set port alias fe.3.3 Admin
```

This example shows how to clear the alias for fe.3.3:

```
A2 (rw) ->set port alias fe.3.3
```

3.3.3 Setting Speed and Duplex Mode

Purpose

To review and set the operational speed in Mbps and the default duplex mode: **Half**, for half duplex, or **Full**, for full duplex for one or more ports.

NOTE: These settings only take effect on ports that have auto-negotiation disabled.

Commands

The commands used to review and set port speed and duplex mode are listed below and described in the associated section as shown.

- show port speed ([Section 3.3.3.1](#))
- set port speed ([Section 3.3.3.2](#))
- show port duplex ([Section 3.3.3.3](#))
- set port duplex ([Section 3.3.3.4](#))

3.3.3.1 show port speed

Use this command to display the default speed setting on one or more ports.

show port speed [*port-string*]

Syntax Description

<i>port-string</i>	(Optional) Displays default speed setting(s) for specific port(s). For a detailed description of possible <i>port-string</i> values, refer to Section 3.1.1 .
--------------------	---

Command Defaults

If *port-string* is not specified, default speed settings for all ports will display.

Command Mode

Read-Only.

Example

This example shows how to display the default speed setting for 1-Fast Ethernet port 14 in unit 3:

```
A2 (rw) -> show port speed fe.3.14
default speed is 10 on port fe.3.14.
```

3.3.3.2 set port speed

Use this command to set the default speed of one or more ports. This setting only takes effect on ports that have auto-negotiation disabled.

set port speed *port-string* {**10** | **100**}

Syntax Description

<i>port-string</i>	Specifies the port(s) for which to a speed value will be set. For a detailed description of possible <i>port-string</i> values, refer to Section 3.1.1 .
10 100	Specifies the port speed. Valid values are: 10 Mbps or 100 Mbps.

Command Defaults

None.

Command Mode

Read-Write.

Example

This example shows how to set fe.3.3 to a port speed of 10 Mbps:

```
A2 (rw) ->set port speed fe.3.3 10
```

3.3.3.3 show port duplex

Use this command to display the default duplex setting (half or full) for one or more ports.

show port duplex [*port-string*]

Syntax Description

<i>port-string</i>	(Optional) Displays default duplex setting(s) for specific port(s). For a detailed description of possible <i>port-string</i> values, refer to Section 3.1.1 .
--------------------	--

Command Defaults

If *port-string* is not specified, default duplex settings for all ports will be displayed.

Command Mode

Read-Only.

Example

This example shows how to display the default duplex setting for Fast Ethernet port 14 on unit 3:

```
A2 (rw) -> show port duplex fe.3.14
default duplex mode is full on port fe.3.14.
```

3.3.3.4 set port duplex

Use this command to set the default duplex type for one or more ports.

set port duplex *port-string* {**full** | **half**}

NOTE: This command will only take effect on ports that have auto-negotiation disabled.

Syntax Description

<i>port-string</i>	Specifies the port(s) for which duplex type will be set. For a detailed description of possible <i>port-string</i> values, refer to Section 3.1.1 .
full half	Sets the port(s) to full-duplex or half-duplex operation.

Command Defaults

None.

Command Mode

Read-Write.

Example

This example shows how to set Fast Ethernet port 17 in unit 1 to full duplex:

```
A2 (rw) -> set port duplex fe.1.17 full
```

3.3.4 Enabling / Disabling Jumbo Frame Support

Purpose

To review, enable, and disable jumbo frame support on one or more ports. This allows Ethernet ports to transmit frames up to 10 KB in size.

Commands

The commands used to review, enable and disable jumbo frame support are listed below and described in the associated section as shown.

- show port jumbo ([Section 3.3.4.1](#))
- set port jumbo ([Section 3.3.4.2](#))
- clear port jumbo ([Section 3.3.4.3](#))

3.3.4.1 show port jumbo

Use this command to display the status of jumbo frame support and maximum transmission units (MTU) on one or more ports.

show port jumbo [*port-string*]

Syntax Description

<i>port-string</i>	(Optional) Displays the status of jumbo frame support for specific port(s). For a detailed description of possible <i>port-string</i> values, refer to Section 3.1.1 .
--------------------	--

Command Defaults

If *port-string* is not specified, jumbo frame support status for all ports will display.

Command Mode

Read-Only.

Example

This example shows how to display the status of jumbo frame support for fe.1.1:

```
A2 (rw) ->show port jumbo fe.1.1
```

Port Number	Jumbo Status	Max Frame Size
-----	-----	-----
fe.1.1	Enable	9216

3.3.4.2 set port jumbo

Use this command to enable or disable jumbo frame support on one or more ports.

set port jumbo {enable | disable} [*port-string*]

Syntax Description

enable disable	Enables or disables jumbo frame support.
<i>port-string</i>	(Optional) Specifies the port(s) on which to disable or enable jumbo frame support. For a detailed description of possible <i>port-string</i> values, refer to Section 3.1.1 .

Command Defaults

If *port-string* is not specified, jumbo frame support will be enabled or disabled on all ports.

Command Mode

Read-Write.

Example

This example shows how to enable jumbo frame support for Fast Ethernet port 14 in unit 3:

A2 (rw) ->**set port jumbo enable fe.3.14**

3.3.4.3 clear port jumbo

Use this command to reset jumbo frame support status to enabled on one or more ports.

clear port jumbo [*port-string*]

Syntax Description

<i>port-string</i>	(Optional) Specifies the port(s) on which to reset jumbo frame support status to enabled. For a detailed description of possible <i>port-string</i> values, refer to Section 3.1.1 .
--------------------	--

Command Defaults

If *port-string* is not specified, jumbo frame support status will be reset on all ports.

Command Mode

Read-Write.

Example

This example shows how to reset jumbo frame support status for Fast Ethernet port 14 in unit 3:

```
A2 (rw) ->clear port jumbo fe.3.14
```

3.3.5 Setting Auto-Negotiation

Purpose

To review, disable or enable auto-negotiation, and to configure port advertisement for speed and duplex.

During auto-negotiation, the port “tells” the device at the other end of the segment what its capabilities and mode of operation are. If auto-negotiation is disabled, the port reverts to the values specified by default speed, default duplex, and the port flow control commands.

Commands

The commands used to review and configure auto-negotiation and port advertisement are listed below and described in the associated section as shown.

- show port negotiation ([Section 3.3.5.1](#))
- set port negotiation ([Section 3.3.5.2](#))
- show port advertise ([Section 3.3.5.3](#))
- set port advertise ([Section 3.3.5.4](#))
- clear port advertise ([Section 3.3.5.5](#))

3.3.5.1 show port negotiation

Use this command to display the status of auto-negotiation for one or more ports.

show port negotiation [*port-string*]

Syntax Description

<i>port-string</i>	(Optional) Displays auto-negotiation status for specific port(s). For a detailed description of possible <i>port-string</i> values, refer to Section 3.1.1 .
--------------------	--

Command Defaults

If *port-string* is not specified, auto-negotiation status for all ports will be displayed.

Command Mode

Read-Only.

Example

This example shows how to display auto-negotiation status for 1-Fast Ethernet port 14 in unit 3:

```
A2 (rw) ->show port negotiation fe.3.14
auto-negotiation is enabled on port fe.3.14.
```

3.3.5.2 set port negotiation

Use this command to enable or disable auto-negotiation on one or more ports.

set port negotiation *port-string* {**enable** | **disable**}

Syntax Description

<i>port-string</i>	Specifies the port(s) for which to enable or disable auto-negotiation. For a detailed description of possible <i>port-string</i> values, refer to Section 3.1.1 .
enable disable	Enables or disables auto-negotiation.

Command Defaults

None.

Command Mode

Read-Write.

Example

This example shows how to disable auto-negotiation on 1-Fast Ethernet port 3 in unit 14:

```
A2 (rw) ->set port negotiation fe.3.14 disable
```

3.3.5.3 show port advertise

Use this command to display a port's actual speed/duplex capabilities along with the port's advertised speed/duplex capabilities to be used in auto-negotiation.

show port advertise [*port-string*]

Syntax Description

<i>port-string</i>	(Optional) Displays advertised ability for specific port(s). For a detailed description of possible <i>port-string</i> values, refer to Section 3.1.1 .
--------------------	---

Command Defaults

If *port-string* is not specified, advertisement for all ports will be displayed.

Command Mode

Read-Only.

Example

This example shows how to display advertisement status for ports 13 and 14:

```
A2(su)->show port advertise fe.2.13-14
fe.2.13      capability  advertised  remote
-----
10BASE-T      yes          yes         no
10BASE-TFD    yes          yes         no
100BASE-TX     yes          yes         no
100BASE-TXFD  yes          yes         no
1000BASE-T     no           no          no
1000BASE-TFD  no           no          no
pause         yes          yes         no

fe.2.14      capability  advertised  remote
-----
10BASE-T      yes          yes         no
10BASE-TFD    yes          yes         no
100BASE-TX     yes          yes         no
100BASE-TXFD  yes          yes         no
1000BASE-T     no           no          no
1000BASE-TFD  no           no          no
pause         yes          yes         no
```

3.3.5.4 set port advertise

Use this command to configure what a port will advertise for speed/duplex capabilities in auto-negotiation.

```
set port advertise {port-string} {10t | 10tfd | 100tx | 100txfd | 1000t | 1000tfd | pause}
```

Syntax Description

<i>port-string</i>	Select the ports for which to configure advertisements. For a detailed description of possible <i>port-string</i> values, refer to Section 3.1.1 .
10t	Advertises 10BASE-T half duplex mode.
10tfd	Advertises 10BASE-T full duplex mode.
100tx	Advertises 100BASE-TX half duplex mode.
100txfd	Advertises 100BASE-TX full duplex mode.
1000t	Advertises 1000BASE-T half duplex mode.
1000tfd	Advertises 1000BASE-T full duplex mode.
pause	Advertises PAUSE for full-duplex links.

Command Defaults

None.

Command Mode

Read-Write.

Example

This example shows how to configure port 10 to advertise 1000BASE-T full duplex:

```
A2 (su) ->set port advertise fe.2.10 100txfd
```

3.3.5.5 clear port advertise

Use this command to configure a port to not advertise a specific speed/duplex capability when auto-negotiating with another port.

```
clear port advertise {port-string} {10t | 10tfd | 100tx | 100txfd | 1000t | 1000tfd |  
pause}
```

Syntax Description

<i>port-string</i>	Clear advertisements for specific port(s). For a detailed description of possible <i>port-string</i> values, refer to Section 3.1.1 .
10t	Do not Advertise 10BASE-T half duplex mode.
10tfd	Do not Advertise 10BASE-T full duplex mode.
100tx	Do not Advertise 100BASE-TX half duplex mode.
100txfd	Do not Advertise 100BASE-TX full duplex mode.
1000t	Do not Advertise 1000BASE-T half duplex mode.
1000tfd	Do not Advertise 1000BASE-T full duplex mode.
pause	Do not Advertise PAUSE for full-duplex links.

Command Defaults

None.

Command Mode

Read-Write.

Example

This example shows how to configure port 1 to not advertise 10 Mbps capability, half and full duplex, for auto-negotiation:

```
A2(su)->show port advertise fe.2.1
fe.2.1      capability    advertised    remote
-----
10BASE-T      yes          yes          no
10BASE-TFD    yes          yes          no
100BASE-TX     yes          yes          no
100BASE-TXFD   yes          yes          no
1000BASE-T     no           no           no
1000BASE-TFD   no           no           no
pause         yes          yes          no

A2(su)->clear port advertise fe.2.1 10t 10tfd
A2(su)->show port advertise fe.2.1

```

3.3.6 Setting Flow Control

Purpose

To review, enable or disable port flow control. Flow control is used to manage the transmission between two devices as specified by IEEE 802.3x to prevent receiving ports from being overwhelmed by frames from transmitting devices.

Commands

The commands used to review and set port flow control are listed below and described in the associated section as shown.

- show flowcontrol ([Section 3.3.6.1](#))
- set flowcontrol ([Section 3.3.6.2](#))

3.3.6.1 **show flowcontrol**

Use this command to display the flow control state.

show flowcontrol

Syntax Description

None.

Command Defaults

None.

Command Mode

Read-Only.

Example

This example shows how to display the port flow control state:

```
A2 (rw) -> show flowcontrol  
Flow control status: enabled
```

3.3.6.2 set flowcontrol

Use this command to enable or disable flow control.

set flowcontrol {enable | disable}

Syntax Description

enable disable	Enables or disables flow control settings.
-------------------------	--

Command Defaults

None.

Command Mode

Read-Write.

Example

This example shows how to enable flow control:

```
A2 (rw) -> set flowcontrol enable
```

3.3.7 Setting Port Traps

Purpose

To display the status, and to enable or disable an SNMP link trap on one or more ports. This operation is typically used to alert the system manager of a change in the link status of the port.

Commands

The commands needed to display, enable or disable port traps are listed below and described in the associated section as shown.

- show port trap ([Section 3.3.7.1](#))
- set port trap ([Section 3.3.7.2](#))

3.3.7.1 show port trap

Use this command to display whether the port is enabled for generating an SNMP trap message if its link state changes.

show port trap [*port-string*]

Syntax Description

<i>port-string</i>	(Optional) Displays link trap status for specific port(s). For a detailed description of possible <i>port-string</i> values, refer to Section 3.1.1 .
--------------------	---

Command Defaults

If *port-string* is not specified, the trap status for all ports will be displayed.

Command Mode

Read-Only.

Example

This example shows how to display link trap status for fe.3.1 through 4:

```
A2 (rw) ->show port trap fe.3.1-4
Link traps enabled on port fe.3.1.
Link traps enabled on port fe.3.2.
Link traps enabled on port fe.3.3.
Link traps enabled on port fe.3.4.
```

3.3.7.2 set port trap

Use this command to enabled or disable ports from sending an SNMP trap message if its link state changes (link goes up or down).

```
set port trap [port-string] {enable | disable}
```

Syntax Description

<i>port-string</i>	Specifies the port(s) for which to enable or disable link state traps. For a detailed description of possible <i>port-string</i> values, refer to Section 3.1.1 .
enable disable	Enables or disables a trap on the specified port.

Command Defaults

None.

Command Mode

Read-Write.

Example

This example shows how to disable link state traps for ports fe.1.1 through 4:

A2 (rw) ->set port trap fe.1.1-4 disable

3.3.8 Configuring Broadcast Suppression

Purpose

To review and set the broadcast suppression threshold for one or more ports. This feature limits the number of received broadcast frames the switch will accept per port. Broadcast suppression thresholds apply only to broadcast traffic—multicast traffic is not affected. By default, a broadcast suppression threshold of 14881 packets per second (pps) will be used, regardless of actual port speed. Broadcast suppression protects against broadcast storms and ARP sweeps.

Commands

The commands used to review and configure port broadcast suppression are listed below and described in the associated section as shown.

- show port broadcast ([Section 3.3.8.1](#))
- set port broadcast ([Section 3.3.8.2](#))
- clear port broadcast ([Section 3.3.8.3](#))

3.3.8.1 show port broadcast

Use this command to display port broadcast suppression limits.

show port broadcast *port-string*

Syntax Description

<i>port-string</i>	(Optional) Select the ports for which to show broadcast suppression thresholds. For a detailed description of possible <i>port-string</i> values, refer to Section 3.1.1 .
--------------------	--

Command Defaults

If no ports are defined then broadcast suppression rates will be shown for all ports.

Command Mode

Read-Only.

Example

This example shows how to display the broadcast suppression thresholds for ports 1 through 5 on unit 2:

A2 (su) -> show port broadcast fe.2.1-5		
Port	Total BC Packets	Threshold (pkts/s)

fe.2.1	0	50
fe.2.2	3305	50
fe.2.3	0	14881
fe.2.4	18578	120
fe.2.5	0	14881

3.3.8.2 set port broadcast

Use this command to set the broadcast suppression limit, in packets per second, on one or more ports. This sets a threshold on the broadcast traffic that is received and switched out to other ports.

set port broadcast *port-string* *threshold_val*

Syntax Description

<i>port-string</i>	Select the ports for which to configure broadcast suppression thresholds. For a detailed description of possible <i>port-string</i> values, refer to Section 3.1.1 .
<i>threshold_val</i>	Sets the packets per second threshold on broadcast traffic. Maximum value is 148810 for Fast Ethernet ports and 1488100 for Gigabit ports.

Command Defaults

None.

Command Mode

Read-Write.

Example

This example configures ports 1 through 5 on unit 2 with a broadcast limit of 50 pps:

```
A2 (su) -> set port broadcast fe.2.1-5 50
```

3.3.8.3 clear port broadcast

Use this command to clear the broadcast threshold limit to the default value of 14881 for the selected port.

clear port broadcast *port-string* **threshold**

Syntax Description

<i>port-string</i>	Select the ports for which to clear broadcast suppression thresholds. For a detailed description of possible <i>port-string</i> values, refer to Section 3.1.1 .
--------------------	--

Command Defaults

None.

Command Mode

Read-Write.

Example

This example clears the broadcast threshold limit to 14881 pps for ports 1 through 5 on unit 2:

```
A2 (su) ->clear port broadcast fe.2.1-5 threshold
```

3.4 PORT MIRRORING

CAUTION: Port mirroring configuration should be performed only by personnel who are knowledgeable about the effects of port mirroring and its impact on network operation.

The SecureStack device allows you to mirror (or redirect) the traffic being switched on a port for the purposes of network traffic analysis and connection assurance. When port mirroring is enabled, one port becomes a monitor port for one or more other ports within the system.

3.4.1 Mirroring Features

The SecureStack A2 device also supports the following mirroring features:

- Mirroring can be configured in a many-to-one configuration so that one target (destination) port can monitor traffic on up to 4 source ports. Only one mirror destination port can be configured per stack.
- Both transmit and receive traffic will be mirrored.
- A mirroring session which is configured to be active (enabled) will be operationally active only if both a destination port and at least one source port have been configured.
- A destination port will only act as a mirroring port when the session is operationally active. If the mirroring session is not operationally active, then the destination port will act as a normal port and participate in all normal operation with respect to transmitting traffic and participating in protocols.

3.4.2 Setting Port Mirroring

Purpose

To review and configure port mirroring on the device.

Commands

The commands used to review and configure port mirroring are listed below and described in the associated section as shown.

- show port mirroring ([Section 3.4.2.1](#))
- set port mirroring ([Section 3.4.2.2](#))
- clear port mirroring ([Section 3.4.2.3](#))

3.4.2.1 show port mirroring

Use this command to display the source and target ports for mirroring, and whether mirroring is currently enabled or disabled for those ports.

show port mirroring

Syntax Description

None.

Command Defaults

None.

Command Mode

Read-Only.

Example

This example shows how to display port mirroring information. In this case, fe.1.4 is configured as a source port and fe.1.11 is a target, but mirroring is not currently enabled between the ports:

```
A2 (rw) -> show port mirroring

Port Mirroring
=====
Source Port = fe.1.4
Target Port = fe.1.11
Frames Mirrored = Rx and Tx
Port Mirroring status disabled.
```

3.4.2.2 set port mirroring

Use this command to create a new mirroring relationship or to enable or disable an existing mirroring relationship between two ports.

NOTE: LAG ports and their underlying physical ports, as described in [Section 3.5](#), cannot be mirrored.

set port mirroring {**create** | **disable** | **enable**} *source destination*

Syntax Description

create disable enable	Creates, disables or enables mirroring settings on the specified ports.
<i>source</i>	Specifies the source port designation. This is the port on which the traffic will be monitored. For a detailed description of possible <i>port-string</i> values, refer to Section 3.1.1 .
<i>destination</i>	Specifies the target port designation. This is the port that will duplicate or “mirror” all the traffic on the monitored port. Only one destination port can be configured per stack. For a detailed description of possible <i>port-string</i> values, refer to Section 3.1.1 .

Command Defaults

None.

Command Mode

Read-Write.

Example

This example shows how to create and enable port mirroring with fe.1.4 as the source port, and fe.1.11 as the target port:

```
A2 (su) -> set port mirroring create fe.1.4 fe.1.11
A2 (su) -> set port mirroring enable fe.1.4 fe.1.11
```

3.4.2.3 clear port mirroring

Use this command to clear a port mirroring relationship.

clear port mirroring *source destination*

Syntax Description

<i>source</i>	Specifies the source port of the mirroring configuration to be cleared. For a detailed description of possible <i>port-string</i> values, refer to Section 3.1.1 .
<i>destination</i>	Specifies the target port of the mirroring configuration to be cleared.

Command Defaults

None.

Command Mode

Read-Write.

Example

This example shows how to clear port mirroring between source port fe.1.4 and target port fe.1.11:

```
A2 (rw) ->clear port mirroring fe.1.4 fe.1.11
```

3.5 LINK AGGREGATION CONTROL PROTOCOL (LACP)

CAUTION: Link aggregation configuration should only be performed by personnel who are knowledgeable about Spanning Tree and Link Aggregation, and fully understand the ramifications of modifications beyond device defaults. Otherwise, the proper operation of the network could be at risk.

Using multiple links simultaneously to increase bandwidth is a desirable switch feature, which can be accomplished if both sides agree on a set of ports that are being used as a Link Aggregation Group (LAG). Once a LAG is formed from selected ports, problems with looping can be avoided since the Spanning Tree can treat this LAG as a single port.

Enabled by default, the Link Aggregation Control Protocol (LACP) logically groups interfaces together to create a greater bandwidth uplink, or link aggregation, according to the IEEE 802.3ad standard. This standard allows the switch to determine which ports are in LAGs and configure them dynamically. Since the protocol is based on the IEEE 802.3ad specification, any switch from any vendor that supports this standard can aggregate links automatically.

802.3ad LACP aggregations can also be run to end-users (that is, a server) or to a router.

NOTE: Earlier (proprietary) implementations of port aggregation referred to groups of aggregated ports as "trunks".

3.5.1 LACP Operation

For each aggregatable port on the switch, LACP:

- Maintains configuration information (reflecting the inherent properties of the individual links as well as those established by management) to control aggregation.
- Exchanges configuration information with other devices to allocate the link to a Link Aggregation Group (LAG).

NOTE: A given link is allocated to, at most, one Link Aggregation Group (LAG) at a time. The allocation mechanism attempts to maximize aggregation, subject to management controls.

- Attaches the port to the aggregator used by the LAG, and detaches the port from the aggregator when it is no longer used by the LAG.

- Uses information from the partner device’s link aggregation control entity to decide whether to aggregate ports.

The operation of LACP involves the following activities:

- Checking that candidate links can actually be aggregated.
- Controlling the addition of a link to a LAG, and the creation of the group if necessary.
- Monitoring the status of aggregated links to ensure that the aggregation is still valid.
- Removing a link from a LAG if its membership is no longer valid, and removing the group if it no longer has any member links.

In order to allow LACP to determine whether a set of links connect to the same device, and to determine whether those links are compatible from the point of view of aggregation, it is necessary to be able to establish the following:

- A globally unique identifier for each device that participates in link aggregation.
- A means of identifying the set of capabilities associated with each port and with each aggregator, as understood by a given device.
- A means of identifying a LAG and its associated aggregator.

3.5.2 LACP Terminology

Table 3-3 defines key terminology used in LACP configuration.

Table 3-3 LACP Terms and Definitions

Term	Definition
Aggregator	Virtual port that controls link aggregation for underlying physical ports. Each SecureStack A2 unit provides 6 aggregator ports, which are designated in the CLI as lag.0.1 through lag.0.6 .
LAG	Link Aggregation Group. Once underlying physical ports (that is, fe.x.x or ge.x.x) are associated with an aggregator port, the resulting aggregation will be represented as one LAG with a lag.0.x port designation. NOTE: SecureStack A2 LAGs can have up to 4 associated physical ports.
LACPDU	Link Aggregation Control Protocol Data Unit. The protocol exchanges aggregation state/mode information by way of a port’s actor and partner operational states. LACPDU’s sent by the first party (the actor) convey to the second party (the actor’s protocol partner) what the actor knows, both about its own state and that of its partner.

Table 3-3 LACP Terms and Definitions (Continued)

Term	Definition
Actor and Partner	An actor is the local device sending LACPDUs. Its protocol partner is the device on the other end of the link aggregation. Each maintains current status of the other via LACPDUs containing information about their ports' LACP status and operational state.
Admin Key	Value assigned to aggregator ports and physical ports that are candidates for joining a LAG. The LACP implementation on SecureStack A2 devices will use this value to form an oper key and will determine which underlying physical ports are capable of aggregating by comparing oper keys. Aggregator ports allow only underlying ports with oper keys matching theirs to join their LAG.
System Priority	Value used to build a LAG ID, which determines aggregation precedence. If there are two partner devices competing for the same aggregator, LACP compares the LAG IDs for each grouping of ports. The LAG with the lower LAG ID is given precedence and will be allowed to use the aggregator.

NOTE: Only one LACP system priority can be set on a SecureStack A2 device, using either the **set lacp asyspri** command (Section 3.5.4.3), or the **set port lacp** command (Section 3.5.4.11).

3.5.3 SecureStack A2 Usage Considerations

In normal usage (and typical implementations) there is no need to modify any of the default LACP parameters on the SecureStack device. The default values will result in the maximum number of aggregations possible. If the switch is placed in a configuration with its peers not running the protocol, no dynamic link aggregations will be formed and the switch will function normally (that is, will block redundant paths). For information about building static aggregations, refer to **set lacp static** (Section 3.5.4.6).

Each SecureStack A2 unit provides six virtual link aggregator ports, which are designated in the CLI as **lag.0.1** through **lag.0.6**. Each LAG can have up to four associated physical ports. Once underlying physical ports (that is, **fe.x.x** or **ge.x.x**) are associated with an aggregator port, the resulting aggregation will be represented as one LAG with a **lag.0.x** port designation. LACP determines which underlying physical ports are capable of aggregating by comparing operational keys. Aggregator ports allow only underlying ports with keys matching theirs to join their LAG.

LACP uses a system priority value to build a LAG ID, which determines aggregation precedence. If there are two partner devices competing for the same aggregator, LACP compares the LAG IDs for each grouping of ports. The LAG with the lower LAG ID is given precedence and will be allowed to use the aggregator.

There are a few cases in which ports will not aggregate:

- An underlying physical port is attached to another port on this same switch (loopback).
- There is no available aggregator for two or more ports with the same LAG ID. This can happen if there are simply no available aggregators, or if none of the aggregators have a matching admin key and system priority.
- 802.1x authentication is enabled using the **set eapol** command ([Section 10.3.2.7](#)) and ports that would otherwise aggregate are not 802.1X authorized.

The LACP implementation on the SecureStack A2 device will allow up to a maximum of four ports into a LAG. The device with the lowest LAG ID determines which underlying physical ports are allowed into a LAG based on the ports' LAG port priority. Ports with the lowest LAG port priority values are allowed into the LAG and all other speed groupings go into a standby state.

When an existing dynamically created LAG is reduced to one port, the SecureStack A2 removes the LAG from its VLAN and adds the remaining underlying port to the VLAN. For this reason, you should ensure that the LAG and all the ports in the LAG are assigned to the egress list of the desired VLAN. Otherwise, when the LAG is removed, the remaining port may be assigned to the wrong VLAN. The other option is to enable the **singleportlag** feature as described in [Section 3.5.4.8](#).

NOTE: To aggregate, underlying physical ports must be running in full duplex mode and must be of the same operating speed.

3.5.4 Configuring Link Aggregation

Purpose

To disable and re-enable the Link Aggregation Control Protocol (LACP), to display and configure LACP settings for one or more aggregator ports, and to display and configure the LACP settings for underlying physical ports that are potential members of a link aggregation.

Commands

The commands used to review and configure LACP are listed below and described in the associated section as shown.

- show lacp ([Section 3.5.4.1](#))
- set lacp ([Section 3.5.4.2](#))
- set lacp asyspri ([Section 3.5.4.3](#))
- set lacp aadminkey ([Section 3.5.4.4](#))
- clear lacp ([Section 3.5.4.5](#))
- set lacp static ([Section 3.5.4.6](#))
- clear lacp static ([Section 3.5.4.7](#))
- set lacp singleportlag ([Section 3.5.4.8](#))
- clear lacp singleportlag ([Section 3.5.4.9](#))
- show port lacp ([Section 3.5.4.10](#))
- set port lacp ([Section 3.5.4.11](#))
- clear port lacp ([Section 3.5.4.12](#))

3.5.4.1 show lacp

Use this command to display information about one or more aggregator ports. Each SecureStack A2 unit provides 6 virtual link aggregator ports, which are designated in the CLI as **lag.0.1** through **lag.0.6**. Once underlying physical ports (that is, **fe.x.x** or **ge.x.x**) are associated with an aggregator port, the resulting aggregation will be represented as one Link Aggregation Group (LAG) with a **lag.0.x** port designation.

show lacp [*port-string*]

Syntax Description

<i>port-string</i>	(Optional) Displays LACP information for specific LAG port(s). Valid port designations are lag.0.1 - 6.
--------------------	---

Command Defaults

If *port-string* is not specified, link aggregation information for all ports will be displayed.

Command Mode

Read-Only.

Example

This example shows how to display lacp information for lag.0.1:

```
A2(su)->show lacp lag.0.1
Global Link Aggregation state: enabled
Single Port LAGs:                disabled

Aggregator: lag.0.1
      Actor                Partner
System Identifier:  00:11:88:11:74:F9    00:01:F4:5F:1E:20
System Priority:    32768                32768
Admin Key:         32768
Oper Key:          32768                0
Attached Ports:    ge.1.1
                  ge.1.3
```

Table 3-4 provides an explanation of the command output.

Table 3-4 show lacp Output Details

Output	What It Displays...
Global Link Aggregation state	Shows if LACP is enabled or disabled on the SecureStack switch.
Single Port LAGs	Shows if the single port LAG feature has been enabled on the switch. See Section 3.5.4.8 for more information about single port LAGs.
Aggregator	LAG port designation. Each SecureStack A2 unit provides 6 virtual link aggregator ports, which are designated in the CLI as lag.0.1 through lag.0.6 . Once underlying physical ports (fe.x.x or ge.x.x) are associated with an aggregator port, the resulting Link Aggregation Group (LAG) is represented with a lag.0.x port designation.
Actor	Local device participating in LACP negotiation.
Partner	Remote device participating in LACP negotiation.
System Identifier	MAC addresses for actor and partner.
System Priority	System priority value which determines aggregation precedence. Only one LACP system priority can be set on a SecureStack A2 device, using either the set lacp asyspri command (Section 3.5.4.3), or the set port lacp command (Section 3.5.4.11).
Admin Key	Port's administratively assigned key.
Oper Key	Port's operational key, derived from the admin key. Only underlying physical ports with oper keys matching the aggregator's will be allowed to aggregate.
Attached Ports	Underlying physical ports associated with this aggregator. SecureStack A2 switches allow up to 4 ports per aggregator.

3.5.4.2 set lacp

Use this command to disable or enable the Link Aggregation Control Protocol (LACP) on the device.

set lacp {disable | enable}

Syntax Description

disable enable	Disables or enables LACP.
-------------------------	---------------------------

Command Defaults

None.

Command Mode

Read-Write.

Example

This example shows how to disable LACP:

```
A2 (rw) -> set lacp disable
```

3.5.4.3 set lacp asyspri

Use this command to set the LACP system priority. LACP uses this value to determine aggregation precedence. If there are two partner devices competing for the same aggregator, LACP compares the LAG IDs for each grouping of ports. The LAG with the lower LAG ID is given precedence and will be allowed to use the aggregator.

set lacp asyspri *value*

Syntax Description

asyspri	Sets the system priority to be used in creating a LAG (Link Aggregation Group) ID. Valid values are 0 to 65535 .
<i>value</i>	Specifies a system priority value. Valid values are 0 to 65535 , with precedence given to lower values.

Command Defaults

None.

Command Mode

Read-Write.

Example

This example shows how to set the LACP system priority to 1000:

```
A2 (rw) ->set lacp asyspri 1000
```

3.5.4.4 set lacp aadminkey

Use this command to set the administratively assigned key for one or more aggregator ports. LACP will use this value to form an oper key. Only underlying physical ports with oper keys matching those of their aggregators will be allowed to aggregate.

set lacp aadminkey *port-string value*

Syntax Description

<i>port-string</i>	Specifies the LAG port(s) on which to assign an admin key.
<i>value</i>	Specifies an admin key value to set. Valid values are 0 to 65535 .

Command Defaults

None.

Command Mode

Read-Write.

Example

This example shows how to set the LACP admin key to 2000 for LAG port 6:

```
A2 (rw) ->set lacp aadminkey lag.0.6 2000
```

3.5.4.5 clear lacp

Use this command to clear LACP system priority or admin key settings.

```
clear lacp {asyspri | aadminkey port-string}
```

Syntax Description

asyspri	Clears system priority.
aadminkey <i>port-string</i>	Clears admin keys for one or more ports.

Command Defaults

None.

Command Mode

Read-Write.

Example

This example shows how to clear the actor admin key for LAG port 6:

```
A2 (rw) ->clear lacp aadminkey lag.0.6
```

3.5.4.6 set lacp static

Use this command to disable or enable static link aggregation, or to assign one or more underlying physical ports to a Link Aggregation Group (LAG).

```
set lacp static {disable | enable} [lagportstring [key] port-string
```

Syntax Description

disable enable	Disables or enables static link aggregation.
<i>lagportstring</i>	Specifies the LAG aggregator port to which new ports will be assigned.
<i>key</i>	(Optional) Specifies the new member port and LAG port aggregator admin key value. Only ports with matching keys are allowed to aggregate. Valid values are 0 - 65535 . <div>NOTE: This key value must be unique. If ports other than the desired underlying physical ports share the same admin key value, aggregation will fail or undesired aggregations will form.</div>
<i>port-string</i>	Specifies the member port(s) to add to the LAG. For a detailed description of possible <i>port-string</i> values, refer to Section 3.1.1 .

Command Defaults

If not specified, a *key* will be assigned according to the specified aggregator. For example a key of 4 would be assigned to lag.0.4.

Command Mode

Read-Write.

Example

This example shows how to add port fe.1.6 to the LAG of aggregator port 6:

```
A2 (rw) ->set lacp static lag.0.6 fe.1.6
```

3.5.4.7 clear lacp static

Use this command to remove specific ports from a Link Aggregation Group.

```
clear lacp static lagportstring port-string
```

Syntax Description

<i>lagportstring</i>	Specifies the LAG aggregator port from which ports will be removed.
<i>port-string</i>	Specifies the port(s) to remove from the LAG. For a detailed description of possible <i>port-string</i> values, refer to Section 3.1.1 .

Command Defaults

None.

Command Mode

Read-Write.

Example

This example shows how to remove fe.1.6 from the LAG of aggregator port 6:

```
A2 (rw) ->clear lacp static lag.0.6 fe.1.6
```

3.5.4.8 **set lacp singleportlag**

Use this command to enable or disable the formation of single port LAGs. When enabled, this maintains LAGs when only one port is receiving protocol transmissions from a partner. If single port LAG is not enabled, when a LAG goes down to one port, the LAG (lag.0.x) will not be used but instead the port’s syntax will be used (for example, fe.3.24). This could cause problems if the LAG and the port have different configurations (the LAG and the port may have different VLAN or Policy configurations).

```
set lacp singleportlag {enable | disable}
```

Syntax Description

disable enable	Enables or disables the formation of single port LAGs.
-------------------------	--

Command Defaults

None.

Command Mode

Read-Write.

Example

This example shows how to enable single port LAGs:

```
A2 (su) -> set lacp singleportlag enable
```

3.5.4.9 clear lacp singleportlag

Use this command to reset the single port LAG function back to the default state of disabled.

clear lacp singleportlag

Syntax Description

None.

Command Defaults

None.

Command Mode

Read-Write.

Example

This example shows how to reset the single port LAG function back to disabled:

```
A2 (su) ->clear lacp singleportlag
```

3.5.4.10 show port lacp

Use this command to display link aggregation information for one or more underlying physical ports.

```
show port lacp port port-string {[status {detail | summary}}] [counters]}
```

Syntax Description

port <i>port-string</i>	Displays LACP information for specific port(s). For a detailed description of possible <i>port-string</i> values, refer to Section 3.1.1 .
status detail summary	Displays LACP status in detailed or summary information.
counters	Displays LACP counter information.

Command Defaults

None.

Command Mode

Read-Only.

Examples

This example shows how to display detailed LACP status information for port fe.1.12:

```
A2 (rw) -> show port lacp port fe.1.12 status detail
Port Instance:                fe.1.12
ActorPort:                    1411    PartnerAdminPort:                1411
ActorSystemPriority:          32768    PartnerOperPort:                1411
ActorPortPriority:            32768    PartnerAdminSystemPriority:      32768
ActorAdminKey:                32768    PartnerOperSystemPriority:       32768
ActorOperKey:                 32768    PartnerAdminPortPriority:        32768
ActorAdminState:              -----G1A  PartnerOperPortPriority:          32768
ActorOperState:               -F-----1A  PartnerAdminKey:                 1411
ActorSystemID:                00-e0-63-9d-b5-87  PartnerOperKey:                 1411
SelectedAggID:                none    PartnerAdminState:              --DCSGlp
AttachedAggID:                none    PartnerOperState:               --DC-Glp
MuxState:                     Detached  PartnerAdminSystemID:           00-00-00-00-00-00
DebugRxState:                 port Disabled  PartnerOperSystemID:           00-00-00-00-00-00
```

NOTE: State definitions, such as ActorAdminState and Partner AdminState, are indicated with letter abbreviations. If the **show port lacp** command displays one or more of the following letters, it means the state is true for the associated actor or partner ports:

E = Expired; **F** = Defaulted; **D** = Distributing (tx enabled); **C** = Collecting (rx enabled); **S** = Synchronized (actor and partner agree); **G** = Aggregation allowed; **S/L** = Short/Long LACP timeout; **A/p** = Active/Passive LACP.

For more information about these states, refer to **set port lacp** ([Section 3.5.4.11](#)) and the IEEE 802.3 2002 specification.

This example shows how to display summarized LACP status information for port fe.1.12:

```
A2 (rw) -> show port lacp port fe.1.12 status summary
Port      Aggr      Actor System      Partner System
          Pri:    System ID:  Key:    Pri: System ID:    Key:
fe.1.12   none [(32768,00e0639db587,32768), (32768,000000000000, 1411)]
```

This example shows how to display LACP counters for port fe.1.12:

```
A2 (rw) -> show port lacp port fe.1.12 counters
Port Instance:      fe.1.12
LACPDUsRx:          11067
LACPDUsTx:           0
IllegalRx:           0
UnknownRx:           0
MarkerPDUsRx:        0
MarkerPDUsTx:        0
MarkerResponsePDUsRx: 0
MarkerResponsePDUsTx: 374
```

3.5.4.11 set port lacp

Use this command to set link aggregation parameters for one or more ports. These settings will determine the specified underlying physical ports’ ability to join a LAG, and their administrative state once aggregated.

```
set port lacp port port-string {[aadminkey aadminkey] [aadminstate  
{lacpactive | lacptimeout | lacpagg | lacpsync | lacpcollect | lacpdist | lacpdef |  
lacpexpire}] [aportpri aportpri] [asyspri asyspri] [enable | [disable]  
[padminkey padminkey] [padminport padminport] [padminportpri  
padminportpri] [padminstate {lacpactive | lacptimeout | lacpagg | lacpsync |  
lacpcollect | lacpdist | lacpdef | lacpexpire}] [padminsysid padminsysid]  
[padminsyspri padminsyspri]
```

Syntax Description

port <i>port-string</i>	Specifies the physical port(s) on which to configure LACP. For a detailed description of possible <i>port-string</i> values, refer to Section 3.1.1 .
aadminkey <i>aadminkey</i>	Sets the port’s actor admin key. LACP will use this value to form an oper key and will determine which underlying physical ports are capable of aggregating by comparing oper keys. Aggregator ports allow only underlying ports with oper keys matching theirs to join their LAG. Valid values are 1 - 65535 . The default key value is 32768.
aadminstate lacpactive lacptimeout lacpagg lacpsync lacpcollect lacpdist lacpdef lacpexpire	Sets the port’s actor LACP administrative state to allow for: <ul style="list-style-type: none">• lacpactive - Transmitting LACP PDUs.• lacptimeout - Transmitting LACP PDUs every 1 sec. vs 30 sec. (default).• lacpagg - Aggregation on this port.• lacpsync - Transition to synchronization state.• lacpcollect - Transition to collection state.• lacpdist - Transition to distribution state.• lacpdef - Transition to defaulted state.• lacpexpire - Transition to expired state.

aportpri <i>aportpri</i>	Sets the port's actor port priority. Valid values are 0 - 65535 , with lower values designating higher priority.
asyspri <i>asyspri</i>	Sets the port's actor system priority. The LACP implementation on the SecureStack A2 device uses this value to determine aggregation precedence when there are two devices competing for the same aggregator. Valid values are 0 - 65535 , with higher precedence given to lower values.
<div style="display: flex; align-items: center;">  <div style="margin-left: 10px;"> <p>NOTE: Only one LACP system priority can be set on a SecureStack A2 device, using either this command, or the set lacp asyspri command (Section 3.5.4.3).</p> </div> </div>	
enable	(Optional) Enables LACPDU processing on this port.
disable	(Optional) Disables LACPDU processing on this port.
padminkey <i>padminkey</i>	Sets a default value to use as the port's partner admin key. Only ports with matching admin keys are allowed to aggregate. Valid values are 1 - 65535 .
padminport <i>padminport</i>	Sets a a default value to use as the port's partner admin value. Valid values are 1 - 65535 .
padminportpri <i>padminportpri</i>	Sets a a default value to use as the port's partner port priority. Valid values are 0 - 65535 , with lower values given higher priority.
padminstate lacpactive lacptimeout lacpagg lacpsync lacpcollect lacpdist lacpdef lacpexpire	Sets a port's partner LACP administrative state. See aadminstate for valid options.
padminsysid <i>padminsysid</i>	Sets a default value to use as the port's partner system ID. This is a MAC address.
padminsyspri <i>padminsyspri</i>	Sets a default value to use as the port's partner priority. Valid values are 0 - 65535 , with lower values given higher priority.

Command Defaults

- At least one parameter must be entered per *port-string*.
- If **enable** or **disable** are not specified, port(s) will be enabled with the LACP parameters entered.

Example

This example shows how to set the actor admin key to 3555 for port fe.3.16:

```
A2 (rw) -> set port lacp fe.3.16 aadminkey 3555
```

3.5.4.12 clear port lacp

Use this command to clear link aggregation settings for one or more ports.

```
clear port lacp port port-string {[aadminkey] [aportpri] [asyspri]
[aadminstate {lacpactive | lacptimeout | lacpagg | lacpsync | lacpcollect |
lacpdist | lacpdef | lacpexpire | all}] [padminsyspri] [padminsysid]
[padminkey] [padminportpri] [padminport] [aadminstate {lacpactive |
lacptimeout | lacpagg | lacpsync | lacpcollect | lacpdist | lacpdef | lacpexpire |
all}]}
```

Syntax Description

port <i>port-string</i>	Specifies the physical port(s) on which LACP settings will be cleared. For a detailed description of possible <i>port-string</i> values, refer to Section 3.1.1 .
aadminkey	Clears a port's actor admin key.
aportpri	Clears a port's actor port priority.
asyspri	Clears the port's actor system priority.
aadminstate lacpactive lacptimeout lacpagg lacpsync lacpcollect lacpdist lacpdef lacpexpire all	Clears a port's specific actor admin state, or all actor admin state(s). For descriptions of specific states, refer to the set port lacp command (Section 3.5.4.11).
padminsyspri	Clears the port's default partner priority value.
padminsysid	Clears the port's default partner system ID.
padminkey	Clears the port's default partner admin key.
padminportpri	Clears the port's default partner port priority.
padminport	Deletes a partner port from the LACP configuration.

padminstate	Clears the port’s specific partner admin state, or all partner admin state(s).
lacpactive	
lacptimeout	
lacpagg lacpsync	
lacpcollect	
lacpdist lacpdef	
lacpexpire all	

Command Defaults

None.

Command Mode

Read-Write.

Example

This example shows how to clear all link aggregation parameters for port fe.3.16:

```
A2 (rw) ->clear port lacp port fe.3.16
```

3.6 CONFIGURING PROTECTED PORTS

The Protected Port feature is used to prevent ports from forwarding traffic to each other, even when they are on the same VLAN. Ports may be designated as either protected or unprotected. Ports are unprotected by default. Multiple groups of protected ports are supported.

3.6.1 Protected Port Operation

Ports that are configured to be protected cannot forward traffic to other protected ports in the same group, regardless of having the same VLAN membership. However, protected ports can forward traffic to ports which are unprotected (not listed in any group). Protected ports can also forward traffic to protected ports in a different group, if they are in the same VLAN. Unprotected ports can forward traffic to both protected and unprotected ports. A port may belong to only one group of protected ports.

This feature only applies to ports within a switch. It does not apply across multiple switches in a network.

3.6.2 Protected Port Command Set

Purpose

To create groups of protected ports, assign and remove ports to/from groups, and display information about protected ports.

Commands

- set port protected ([Section 3.6.2.1](#))
- show port protected ([Section 3.6.2.2](#))
- clear port protected ([Section 3.6.2.3](#))
- set port protected name ([Section 3.6.2.4](#))
- show port protected name ([Section 3.6.2.5](#))
- clear port protected name ([Section 3.6.2.6](#))

3.6.2.1 set port protected

Use this command to specify a port to be protected and assign the port to a group of protected ports. A port can be assigned to only one group.

set port protected *port-string* *group-id*

Syntax Description

<i>port-string</i>	Specifies the port or ports to be protected.
<i>group-id</i>	Specifies the id of the group to which the ports should be assigned. Id can range from 0 to 2.

Command Defaults

None.

Command Mode

Read-write.

Example

This example shows how to assign ports ge.1.1 through ge.1.3 to protected port group 1:

```
A2 (rw) ->set port protected ge.1.1-3 1
```

3.6.2.2 show port protected

Use this command to display information about the ports configured for protected mode.

show port protected [*port-string*] | [*group-id*]

Syntax Description

<i>port-string</i>	(Optional) Specifies the port or ports for which to display information.
<i>group-id</i>	(Optional) Specifies the id of the group for which to display information. Id can range from 0 to 2.

Command Defaults

If no parameters are entered, information about all protected ports is displayed.

Command Mode

Read-only.

Example

This example shows how to display information about all protected ports:

```
A2(ro)->show port protected
Group id      Port
-----
1             ge.1.1
1             ge.1.2
1             ge.1.3
```

3.6.2.3 clear port protected

Use this command to remove a port or group from protected mode.

clear port protected [*port-string*] | [*group-id*]

Syntax Description

<i>port-string</i>	(Optional) Specifies the port or ports to remove from protected mode.
<i>group-id</i>	(Optional) Specifies the id of the group to remove from protected mode. Id can range from 0 to 2.

Command Defaults

If no parameters are entered, all protected ports and groups are cleared.

Command Mode

Read-write.

Example

This example shows how to clear protected ports ge.1.1 through ge.1.3:

A2 (rw) ->**clear port protected** ge.1.1-3

3.6.2.4 set port protected name

Use this command to assign a name to a protected port group id.

set port protected name *group-id name*

Syntax Description

<i>group-id</i>	Specifies the id of this group. Id can range from 0 to 2.
<i>name</i>	Specifies a name for the group. The name can be up to 32 characters in length.

Command Defaults

None.

Command Mode

Read-write.

Example

This example shows how to assign the name “group1” to protected port group 1:

```
A2 (rw) -> set port protected name 1 group1
```

3.6.2.5 show port protected name

Use this command to display the name for the group ids specified.

show port protected name *group-id*

Syntax Description

<i>group-id</i>	Specifies the id of the group to display. Id can range from 0 to 2.
-----------------	---

Command Defaults

None.

Command Mode

Read-only.

Example

This example shows how to show the name of protected port group 1:

```
A2(ro)->show port protected name 1
Group ID      Group Name
-----
1             group1
```

3.6.2.6 clear port protected name

Use this command to clear the name of a protected group.

clear port protected name *group-id*

Syntax Description

<i>group-id</i>	Specifies the id of the group for which to clear the name. Id can range from 0 to 2.
-----------------	---

Command Defaults

None.

Command Mode

Read-write.

Example

This example shows how to clear the name of protected port group 1:

```
A2 (rw) ->clear port protected name 1
```

SNMP Configuration

This chapter describes the Simple Network Management Protocol (SNMP) set of commands and how to use them.

4.1 SNMP CONFIGURATION SUMMARY

SNMP is an application-layer protocol that facilitates the exchange of management information between network devices. SNMP enables network administrators to manage network performance, find and solve network problems, and plan for network growth.

SecureStack A2 devices support three versions of SNMP:

- Version 1 (SNMPv1) — This is the initial implementation of SNMP. Refer to RFC 1157 for a full description of functionality.
- Version 2 (SNMPv2c) — The second release of SNMP, described in RFC 1907, has additions and enhancements to data types, counter size, and protocol operations.
- Version 3 (SNMPv3) — This is the most recent version of SNMP, and includes significant enhancements to administration and security. SNMPv3 is fully described in RFC 2571, RFC 2572, RFC 2573, RFC 2574, and RFC 2575.

4.1.1 SNMPv1 and SNMPv2c

The components of SNMPv1 and SNMPv2c network management fall into three categories:

- Managed devices (such as a switch)
- SNMP agents and MIBs, including SNMP traps, community strings, and Remote Monitoring (RMON) MIBs, which run on managed devices
- SNMP network management applications, such as Enterasys NetSight, which communicate with agents to get statistics and alerts from the managed devices.

4.1.2 SNMPv3

SNMPv3 is an interoperable standards-based protocol that provides secure access to devices by authenticating and encrypting frames over the network. The advanced security features provided in SNMPv3 are as follows:

- Message integrity — Collects data securely without being tampered with or corrupted.
- Authentication — Determines the message is from a valid source.
- Encryption — Scrambles the contents of a frame to prevent it from being seen by an unauthorized source.

Unlike SNMPv1 and SNMPv2c, in SNMPv3, the concept of SNMP agents and SNMP managers no longer apply. These concepts have been combined into an SNMP entity. An SNMP entity consists of an SNMP engine and SNMP applications. An SNMP engine consists of the following four components:

- Dispatcher — This component sends and receives messages.
- Message processing subsystem — This component accepts outgoing PDUs from the dispatcher and prepares them for transmission by wrapping them in a message header and returning them to the dispatcher. The message processing subsystem also accepts incoming messages from the dispatcher, processes each message header, and returns the enclosed PDU to the dispatcher.
- Security subsystem — This component authenticates and encrypts messages.
- Access control subsystem — This component determines which users and which operations are allowed access to managed objects.

4.1.3 About SNMP Security Models and Levels

An SNMP security model is an authentication strategy that is set up for a user and the group in which the user resides. A security level is the permitted level of security within a security model. The three levels of SNMP security are: No authentication required (NoAuthNoPriv); authentication required (AuthNoPriv); and privacy (authPriv). A combination of a security model and a security level determines which security mechanism is employed when handling an SNMP frame. [Table 4-1](#) identifies the levels of SNMP security available on SecureStack A2 devices and authentication required within each model.

Table 4-1 SNMP Security Levels

Model	Security Level	Authentication	Encryption	How It Works
v1	NoAuthNoPriv	Community string	None	Uses a community string match for authentication.

Table 4-1 SNMP Security Levels (Continued)

Model	Security Level	Authentication	Encryption	How It Works
v2c	NoAuthNoPriv	Community string	None	Uses a community string match for authentication.
v3	NoAuthNoPriv	User name	None	Uses a user name match for authentication.
	AuthNoPriv	MD5 or SHA	None	Provides authentication based on the HMAC-MD5 or HMAC-SHA algorithms.
	authPriv	MD5 or SHA	DES	Provides authentication based on the HMAC-MD5 or HMAC-SHA algorithms. Provides DES 56-bit encryption in addition to authentication based on the CBC-DES (DES-56) standard.

4.1.4 Using SNMP Contexts to Access Specific MIBs

By default, when operating from the switch CLI, SecureStack A2 devices allow access to all SNMP MIBs or contexts. A context is a collection of MIB objects, often associated with a particular physical or logical device.

If no optional *context* parameters are configured for v1 and v2 “community” names and v3 “user” groups, these groups are able to access all SNMP MIB objects when in switch mode.

Specifying a *context* parameter when setting up SNMP user group would permit or restrict the group’s switch management access to the MIB(s) specified by the *context* (MIB object ID) value.

All SNMP contexts known to the device can be displayed using the **show snmp context** command as described in [Section 4.3.4.2](#).

Example

This example permits the “powergroup” to manage all MIBs via SNMPv3:

```
A2 (rw) ->set snmp access powergroup security-model usm
```

4.2 PROCESS OVERVIEW: SNMP CONFIGURATION

NOTE: Commands for configuring SNMP on the SecureStack A2 device are independent during the SNMP setup process. For instance, target parameters can be specified when setting up optional notification filters — even though these parameters have not yet been created with the **set snmp targetparams** command. The following steps are a guideline to configuring SNMP and do not necessarily need to be executed in this order.

Use the following steps as a guide to configuring SNMP on the device:

1. Reviewing SNMP statistics ([Section 4.3.1](#))
2. Configuring SNMP users, groups and communities ([Section 4.3.2](#))
3. Configuring SNMP access rights ([Section 4.3.3](#))
4. Configuring SNMP MIB views ([Section 4.3.4](#))
5. Configuring SNMP target parameters ([Section 4.3.5](#))
6. Configuring SNMP target addresses ([Section 4.3.6](#))
7. Configuring SNMP notification parameters ([Section 4.3.7](#))
8. Creating a basic SNMP trap configuration ([Section 4.3.8](#))

4.3 SNMP CONFIGURATION COMMAND SET

4.3.1 Reviewing SNMP Statistics

Purpose

To review SNMP statistics.

Commands

The commands used to review SNMP statistics are listed below and described in the associated section as shown.

- show snmp engineid ([Section 4.3.1.1](#))
- show snmp counters ([Section 4.3.1.2](#))

4.3.1.1 show snmp engineid

Use this command to display the SNMP local engine ID. This is the SNMP v3 engine’s administratively unique identifier.

show snmp engineid

Syntax Description

None.

Command Defaults

None.

Command Mode

Read-Only.

Example

This example shows how to display SNMP engine properties:

```
A2 (rw)->show snmp engineid
EngineId: 80:00:15:f8:03:00:e0:63:9d:b5:87
Engine Boots      = 12
Engine Time       = 162181
Max Msg Size      = 2048
```

Table 4-2 shows a detailed explanation of the command output.

Table 4-2 show snmp engineid Output Details

Output	What It Displays...
Engineid	String identifying the SNMP agent on the device.
Engine Boots	Number of times the SNMP engine has been started or reinitialized.
Engine Time	Time in seconds since last reboot.
Max Msg Size	Maximum accepted length, in bytes, of SNMP frame.

4.3.1.2 show snmp counters

Use this command to display SNMP traffic counter values.

show snmp counters

Syntax Description

None.

Command Defaults

None.

Command Mode

Read-Only.

Example

This example shows how to display SNMP counter values:

```
A2 (rw) ->show snmp counters

--- mib2 SNMP group counters:
snmpInPkts           = 396601
snmpOutPkts          = 396601
snmpInBadVersions    = 0
snmpInBadCommunityNames = 0
snmpInBadCommunityUses = 0
snmpInASNParseErrs   = 0
snmpInTooBigS        = 0
snmpInNoSuchNames    = 0
snmpInBadValues       = 0
snmpInReadOnlys      = 0
snmpInGenErrs         = 0
snmpInTotalReqVars    = 403661
snmpInTotalSetVars    = 534
snmpInGetRequests     = 290
snmpInGetNexts        = 396279
snmpInSetRequests     = 32
snmpInGetResponses    = 0
snmpInTraps           = 0
snmpOutTooBigS        = 0
snmpOutNoSuchNames    = 11
snmpOutBadValues      = 0
snmpOutGenErrs        = 0
snmpOutGetRequests    = 0
snmpOutGetNexts       = 0
```

```
snmpOutSetRequests      = 0
snmpOutGetResponses     = 396601
snmpOutTraps            = 0
snmpSilentDrops         = 0
snmpProxyDrops          = 0

--- USM Stats counters:
usmStatsUnsupportedSecLevels = 0
usmStatsNotInTimeWindows    = 0
usmStatsUnknownUserNames    = 0
usmStatsUnknownEngineIDs    = 0
usmStatsWrongDigests        = 0
usmStatsDecryptionErrors     = 0
```

Table 4-3 shows a detailed explanation of the command output.

Table 4-3 show snmp counters Output Details

Output	What It Displays...
snmpInPkts	Number of messages delivered to the SNMP entity from the transport service.
snmpOutPkts	Number of SNMP messages passed from the SNMP protocol entity to the transport service.
snmpInBadVersions	Number of SNMP messages delivered to the SNMP entity for an unsupported SNMP version.
snmpInBadCommunityNames	Number of SNMP messages delivered to the SNMP entity that used an SNMP community name not known to the entity.
snmpInBadCommunityUses	Number of SNMP messages delivered to the SNMP entity that represented an SNMP operation not allowed by the SNMP community named in the message.
snmpInASNParseErrs	Number of ASN.1 (Abstract Syntax Notation) or BER (Basic Encoding Rules) errors encountered by the SNMP entity when decoding received SNMP messages.
snmpInTooBig	Number of SNMP PDUs delivered to the SNMP protocol entity with the value of the error-status field as "tooBig."
snmpInNoSuchNames	Number of SNMP PDUs delivered to the SNMP protocol entity with the value of the error-status field as "noSuchName."

Table 4-3 show snmp counters Output Details (Continued)

Output	What It Displays...
snmplnBadValues	Number of SNMP PDUs delivered to the SNMP protocol entity with the value of the error-status field as "badValue."
snmplnReadOnlys	Number of valid SNMP PDUs delivered to the SNMP protocol entity with the value of the error-status field as "readOnly."
snmplnGenErrs	Number of SNMP PDUs delivered to the SNMP protocol entity with the value of the error-status field as "genErr."
snmplnTotalReqVars	Number of MIB objects retrieved successfully by the SNMP protocol entity as the result of receiving valid SNMP Get-Request and Get-Next PDUs.
snmplnTotalSetVars	Number of MIB objects altered successfully by the SNMP protocol entity as the result of receiving valid SNMP Set-Request PDUs.
snmplnGetRequests	Number of SNMP Get-Request PDUs accepted and processed by the SNMP protocol entity.
snmplnGetNexts	Number of SNMP Get-Next PDUs accepted and processed by the SNMP protocol entity.
snmplnSetRequests	Number of SNMP Set-Request PDUs accepted and processed by the SNMP protocol entity.
snmplnGetResponses	Number of SNMP Get-Response PDUs accepted and processed by the SNMP protocol entity.
snmplnTraps	Number of SNMP Trap PDUs accepted and processed by the SNMP protocol entity.
snmpOutTooBig	Number of SNMP PDUs generated by the SNMP protocol entity with the value of the error-status field as "tooBig."
snmpOutNoSuchNames	Number of SNMP PDUs generated by the SNMP protocol entity with the value of the error-status as "noSuchName."
snmpOutBadValues	Number of SNMP PDUs generated by the SNMP protocol entity with the value of the error-status field as "badValue."
snmpOutGenErrs	Number of SNMP PDUs generated by the SNMP protocol entity with the value of the error-status field as "genErr."

Table 4-3 show snmp counters Output Details (Continued)

Output	What It Displays...
snmpOutGetRequests	Number of SNMP Get-Request PDUs generated by the SNMP protocol entity.
snmpOutGetNexts	Number of SNMP Get-Next PDUs generated by the SNMP protocol entity.
snmpOutSetRequests	Number of SNMP Set-Request PDUs generated by the SNMP protocol entity.
snmpOutGetResponses	Number of SNMP Get-Response PDUs generated by the SNMP protocol entity.
snmpOutTraps	Number of SNMP Trap PDUs generated by the SNMP protocol entity.
snmpSilentDrops	Number of SNMP Get, Set, or Inform request error messages that were dropped because the reply was larger than the requestor's maximum message size.
snmpProxyDrops	Number of SNMP Get, Set, or Inform request error messages that were dropped because the reply was larger than the proxy target's maximum message size.
usmStatsUnsupportedSec Levels	Number of packets received by the SNMP engine that were dropped because they requested a security level that was unknown to the SNMP engine or otherwise unavailable.
usmStatsNotInTimeWindows	Number of packets received by the SNMP engine that were dropped because they appeared outside of the authoritative SNMP engine's window.
usmStatsUnknownUserNames	Number of packets received by the SNMP engine that were dropped because they referenced a user that was not known to the SNMP engine.
usmStatsUnknownEngineIDs	Number of packets received by the SNMP engine that were dropped because they referenced an snmpEngineID that was not known to the SNMP engine.
usmStatsWrongDigests	Number of packets received by the SNMP engine that were dropped because they did not contain the expected digest value.
usmStatsDecryptionErrors	Number of packets received by the SNMP engine that were dropped because they could not be decrypted.

4.3.2 Configuring SNMP Users, Groups, and Communities

Purpose

To review and configure SNMP users, groups, and v1 and v2 communities. These are defined as follows:

- User — A person registered in SNMPv3 to access SNMP management.
- Group — A collection of users who share the same SNMP access privileges.
- Community — A name used to authenticate SNMPv1 and v2 users.

Commands

The commands used to review and configure SNMP users, groups, and communities are listed below and described in the associated section as shown.

- show snmp user ([Section 4.3.2.1](#))
- set snmp user ([Section 4.3.2.2](#))
- clear snmp user ([Section 4.3.2.3](#))
- show snmp group ([Section 4.3.2.4](#))
- set snmp group ([Section 4.3.2.5](#))
- clear snmp group ([Section 4.3.2.6](#))
- show snmp community ([Section 4.3.2.7](#))
- set snmp community ([Section 4.3.2.8](#))
- clear snmp community ([Section 4.3.2.9](#))

4.3.2.1 show snmp user

Use this command to display information about SNMP users. These are people registered to access SNMP management.

```
show snmp user [list] | [user] | [remote remote] [volatile | nonvolatile | read-only]
```

Syntax Description

list	(Optional) Displays a list of registered SNMP user names.
<i>user</i>	(Optional) Displays information about a specific user.
remote remote	(Optional) Displays information about users on a specific remote SNMP engine.
volatile nonvolatile read-only	(Optional) Displays user information for a specified storage type.

Command Defaults

- If **list** is not specified, detailed SNMP information will be displayed.
- If *user* is not specified, information about all SNMP users will be displayed.
- If **remote** is not specified, user information about the local SNMP engine will be displayed.
- If not specified, user information for all storage types will be displayed.

Command Mode

Read-Only.

Examples

This example shows how to display an SNMP user list:

```
A2 (rw)->show snmp user list
--- SNMP user information ---
--- List of registered users:
Guest
admin1
admin2
netops
```

This example shows how to display information for the SNMP “guest” user:

```
A2 (rw) ->show snmp user guest
--- SNMP user information ---
EngineId:  00:00:00:63:00:00:00:a1:00:00:00:00
Username           = Guest
Auth protocol      = usmNoAuthProtocol
Privacy protocol   = usmNoPrivProtocol
Storage type       = nonVolatile
Row status         = active
```

[Table 4-4](#) shows a detailed explanation of the command output.

Table 4-4 show snmp user Output Details

Output	What It Displays...
EngineId	SNMP local engine identifier.
Username	SNMPv1 or v2 community name or SNMPv3 user name.
Auth protocol	Type of authentication protocol applied to this user.
Privacy protocol	Whether a privacy protocol is applied when authentication protocol is in use.
Storage type	Whether entry is stored in volatile , nonvolatile or read-only memory.
Row status	Status of this entry: active , notInService , or notReady .

4.3.2.2 set snmp user

Use this command to create a new SNMPv3 user.

```
set snmp user user [remote remoteid] [authentication {md5 | sha}]
[authpassword] [privacy privpassword] [volatile | nonvolatile]
```

Syntax Description

<i>user</i>	Specifies a name for the SNMPv3 user.
remote <i>remoteid</i>	(Optional) Registers the user on a specific remote SNMP engine.
authentication md5 sha	(Optional) Specifies the authentication type required for this user as MD5 or SHA.
<i>authpassword</i>	(Optional) Specifies a password for this user when authentication is required. Minimum of 8 characters.
privacy <i>privpassword</i>	(Optional) Applies encryption and specifies an encryption password. Minimum of 8 characters.
volatile nonvolatile	(Optional) Specifies a storage type for this user entry.

Command Defaults

- If **remote** is not specified, the user will be registered for the local SNMP engine.
- If **authentication** is not specified, no authentication will be applied.
- If **privacy** is not specified, no encryption will be applied.
- If storage type is not specified, **nonvolatile** will be applied.

Command Mode

Read-Write.

Example

This example shows how to create a new SNMP user named “netops”. By default, this user will be registered on the local SNMP engine without authentication and encryption. Entries related to this user will be stored in permanent (nonvolatile) memory:

```
A2 (rw) ->set snmp user netops
```

4.3.2.3 clear snmp user

Use this command to remove a user from the SNMPv3 security-model list.

clear snmp user *user* [**remote** *remote*]

Syntax Description

<i>user</i>	Specifies an SNMPv3 user to remove.
remote <i>remote</i>	(Optional) Removes the user from a specific remote SNMP engine.

Command Defaults

If **remote** is not specified, the user will be removed from the local SNMP engine.

Command Mode

Read-Write.

Example

This example shows how to remove the SNMP user named “bill”:

```
A2 (rw) ->clear snmp user bill
```

4.3.2.4 show snmp group

Use this command to display an SNMP group configuration. An SNMP group is a collection of SNMPv3 users who share the same access privileges.

```
show snmp group [groupname groupname] [user user] [security-model {v1 | v2c | usm}] [volatile | nonvolatile | read-only]
```

Syntax Description

groupname <i>groupname</i>	(Optional) Displays information for a specific SNMP group.
user <i>user</i>	(Optional) Displays information about users within the specified group.
security-model v1 v2c usm	(Optional) Displays information about groups assigned to a specific security SNMP model.
volatile nonvolatile read-only	(Optional) Displays SNMP group information for a specified storage type.

Command Defaults

- If *groupname* is not specified, information about all SNMP groups will be displayed.
- If *user* is not specified, information about all SNMP users will be displayed.
- If **security-model** is not specified, user information about all SNMP versions will be displayed.
- If not specified, information for all storage types will be displayed.

Command Mode

Read-Only.

Example

This example shows how to display SNMP group information:

```
A2(rw)->show snmp group
--- SNMP group information ---
Security model           = SNMPv1
Security/user name       = public
Group name               = Anyone
Storage type             = nonVolatile
Row status               = active

Security model           = SNMPv1
Security/user name       = public.router1
Group name               = Anyone
Storage type             = nonVolatile
Row status               = active
```

Table 4-5 shows a detailed explanation of the command output.

Table 4-5 show snmp group Output Details

Output	What It Displays...
Security model	SNMP version associated with this group.
Security/user name	User belonging to the SNMP group.
Group name	Name of SNMP group.
Storage type	Whether entry is stored in volatile , nonvolatile or read-only memory.
Row status	Status of this entry: active , notInService , or notReady .

4.3.2.5 set snmp group

Use this command to create an SNMP group. This associates SNMPv3 users to a group that shares common access privileges.

```
set snmp group groupname user user security-model {v1 | v2c | usm} [volatile | nonvolatile]
```

Syntax Description

<i>groupname</i>	Specifies an SNMP group name to create.
user <i>user</i>	Specifies an SNMPv3 user name to assign to the group.
security-model v1 v2c usm	Specifies an SNMP security model to assign to the group.
volatile nonvolatile	(Optional) Specifies a storage type for SNMP entries associated with the group.

Command Defaults

If storage type is not specified, **nonvolatile** storage will be applied.

Command Mode

Read-Write.

Example

This example shows how to create an SNMP group called “anyone”, assign a user named “public” and assign SNMPv3 security to the group:

```
A2(rw)->set snmp group anyone user public security-model usm
```

4.3.2.6 clear snmp group

Use this command to clear SNMP group settings globally or for a specific SNMP group and user.

clear snmp group *groupname user* [**security-model** {**v1** | **v2c** | **usm**}]

Syntax Description

<i>groupname</i>	Specifies the SNMP group to be cleared.
<i>user</i>	Specifies the SNMP user to be cleared.
security-model v1 v2c usm	(Optional) Clears the settings associated with a specific security model.

Command Defaults

If not specified, settings related to all security models will be cleared.

Command Mode

Read-Write.

Example

This example shows how to clear all settings assigned to the “public” user within the SNMP group “anyone”:

```
A2 (rw) ->clear snmp group anyone public
```

4.3.2.7 show snmp community

Use this command to display SNMP community names and status. In SNMPv1 and v2, community names act as passwords to remote management.

show snmp community [*name*]

Syntax Description

<i>name</i>	(Optional) Displays SNMP information for a specific community name.
-------------	---

Command Defaults

If *name* is not specified, information will be displayed for all SNMP communities.

Command Mode

Read-Only.

Example

This example shows how to display information about the SNMP “public” community name. For a description of this output, refer to **set snmp community** ([Section 4.3.2.8](#)):

```
A2 (rw) ->show snmp community public

--- Configured community strings ---

Name           = public
Security name   = public
Context        =
Transport tag   =
Storage type    = nonVolatile
Status         = active
```

4.3.2.8 set snmp community

Use this command to configure an SNMP community group.

```
set snmp community community [securityname securityname] [context context]  
[transport transport] [volatile | nonvolatile]
```

Syntax Description

<i>community</i>	Specifies a community group name.
securityname <i>securityname</i>	(Optional) Specifies an SNMP security name to associate with this community.
context <i>context</i>	(Optional) Specifies a subset of management information this community will be allowed to access. Valid values are full or partial context names. To review all contexts configured for the device, use the show snmp context command as described in Section 4.3.4.2 .
transport <i>transport</i>	(Optional) Specifies the set of transport endpoints from which SNMP request with this community name will be accepted. Makes a link to a target address table.
volatile nonvolatile	(Optional) Specifies the storage type for these entries.

Command Defaults

None.

- If **securityname** is not specified, the *community* name will be used.
- If **context** is not specified, access will be granted for the default context.
- If **transport** tag is not specified, none will be applied.
- If storage type is not specified, **nonvolatile** will be applied.

Command Mode

Read-Write.

Example

This example shows how to set an SNMP community name called “vip”:

```
A2 (rw) -> set snmp community vip
```

4.3.2.9 clear snmp community

Use this command to delete an SNMP community name.

clear snmp community *name*

Syntax Description

<i>name</i>	Specifies the SNMP community name to clear.
-------------	---

Command Defaults

None.

Command Mode

Read-Write.

Example

This example shows how to delete the community name “vip.”

```
A2 (rw) ->clear snmp community vip
```

4.3.3 Configuring SNMP Access Rights

Purpose

To review and configure SNMP access rights, assigning viewing privileges and security levels to SNMP user groups.

Commands

The commands used to review and configure SNMP access are listed below and described in the associated section as shown.

- show snmp access ([Section 4.3.3.1](#))
- set snmp access ([Section 4.3.3.2](#))
- clear snmp access ([Section 4.3.3.3](#))

4.3.3.1 show snmp access

Use this command to display access rights and security levels configured for SNMP one or more groups.

```
show snmp access [groupname] [security-model {v1 | v2c | usm}]
[noauthentication | authentication | privacy] [context context] [volatile |
nonvolatile | read-only]
```

Syntax Description

<i>groupname</i>	(Optional) Displays access information for a specific SNMPv3 group.
security-model v1 v2c usm	(Optional) Displays access information for SNMP security model version 1, 2c or 3 (usm).
noauthentication authentication privacy	(Optional) Displays access information for a specific security level.
context context	(Optional) Displays access information for a specific context. For a description of how to specify SNMP contexts, refer to Section 4.1.4 .
volatile nonvolatile read-only	(Optional) Displays access entries for a specific storage type.

Command Defaults

- If *groupname* is not specified, access information for all SNMP groups will be displayed.
- If **security-model** is not specified, access information for all SNMP versions will be displayed.
- If **noauthentication**, **authentication** or **privacy** are not specified, access information for all security levels will be displayed.
- If **context** is not specified, all contexts will be displayed.
- If **volatile**, **nonvolatile** or **read-only** are not specified, all entries of all storage types will be displayed.

Command Mode

Read-Only.

Example

This example shows how to display SNMP access information:

```
A2(rw)->show snmp access
Group                = SystemAdmin
Security model       = USM
Security level       = noAuthNoPriv
Read View            = All
Write View           =
Notify View          = All
Context match        = exact match
Storage type         = nonVolatile
Row status           = active

Group                = NightOperator
Security model       = USM
Security level       = noAuthNoPriv
Read View            = All
Write View           =
Notify View          = All
Context match        = exact match
Storage type         = nonVolatile
Row status           = active
```

Table 4-6 shows a detailed explanation of the command output.

Table 4-6 show snmp access Output Details

Output	What It Displays...
Group	SNMP group name.
Security model	Security model applied to this group. Valid types are: SNMPv1 , SNMPv2c , and SNMPv3 (User based - USM).
Security level	Security level applied to this group. Valid levels are: <ul style="list-style-type: none">noAuthNoPrivacy (no authentication required)AuthNoPrivacy (authentication required)authPriv (privacy -- most secure level)
Read View	Name of the view that allows this group to view SNMP MIB objects.
Write View	Name of the view that allows this group to configure the contents of the SNMP agent.

Table 4-6 show snmp access Output Details (Continued)

Output	What It Displays...
Notify View	Name of the view that allows this group to send an SNMP trap message.
Context match	Whether or not SNMP context match must be exact (full context name match) or a partial match with a given prefix.
Storage type	Whether access entries for this group are stored in volatile , nonvolatile or read-only memory.
Row status	Status of this entry: active , notInService , or notReady .

4.3.3.2 set snmp access

Use this command to set an SNMP access configuration.

```
set snmp access groupname security-model {v1 | v2c | usm} [noauthentication
| authentication | privacy] [context context {exact | prefix}] [read read] [write
write] [notify notify] [volatile | nonvolatile]
```

Syntax Description

<i>groupname</i>	Specifies a name for an SNMPv3 group.
security-model v1 v2c usm	Specifies SNMP version 1, 2c or 3 (usm).
noauthentication authentication privacy	(Optional) Applies SNMP security level as no authentication, authentication (without privacy) or privacy. Privacy specifies that messages sent on behalf of the user are protected from disclosure.
context <i>context</i> exact prefix	(Optional) Sets the context for this access configuration and specifies that the match must be exact (matching the whole context string) or a prefix match only. Context is a subset of management information this SNMP group will be allowed to access. Valid values are full or partial context names. To review all contexts configured for the device, use the show snmp context command as described in Section 4.3.4.2 .
read <i>read</i>	(Optional) Specifies a read access view.
write <i>write</i>	(Optional) Specifies a write access view.
notify <i>notify</i>	(Optional) Specifies a notify access view.
volatile nonvolatile read-only	(Optional) Stores associated SNMP entries as temporary or permanent, or read-only.

Command Defaults

- If security level is not specified, no authentication will be applied.
- If **context** is not specified, access will be enabled for the default context. If **context** is specified without a context match, **exact** match will be applied.
- If **read** view is not specified none will be applied.
- If **write** view is not specified, none will be applied.
- If **notify** view is not specified, none will be applied.
- If storage type is not specified, entries will be stored as permanent and will be held through device reboot.

Command Mode

Read-Write.

Example

This example permits the “powergroup” to manage all MIBs via SNMPv3:

```
A2 (rw) -> set snmp access powergroup security-model usm
```

4.3.3.3 clear snmp access

Use this command to clear the SNMP access entry of a specific group, including its set SNMP security-model, and level of security.

```
clear snmp access groupname security-model {v1 | v2c | usm}
[noauthentication | authentication | privacy] [context context]
```

Syntax Description

<i>groupname</i>	Specifies the name of the SNMP group for which to clear access.
security-model v1 v2c usm	Specifies the security model to be cleared for the SNMP access group.
noauthentication authentication privacy	(Optional) Clears a specific security level for the SNMP access group.
context <i>context</i>	(Optional) Clears a specific context for the SNMP access group. Enter / - / to clear the default context.

Command Defaults

- If security level is not specified, all levels will be cleared.
- If **context** is not specified, none will be applied.

Command Mode

Read-Write.

Example

This example shows how to clear SNMP version 3 access for the “mis-group” via the authentication protocol:

A2 (rw) ->clear snmp access mis-group security-model usm authentication

4.3.4 Configuring SNMP MIB Views

Purpose

To review and configure SNMP MIB views. SNMP views map SNMP objects to access rights.

Commands

The commands used to review and configure SNMP MIB views are listed below and described in the associated section as shown.

- show snmp view ([Section 4.3.4.1](#))
- show snmp context ([Section 4.3.4.2](#))
- set snmp view ([Section 4.3.4.3](#))
- clear snmp view ([Section 4.3.4.4](#))

4.3.4.1 show snmp view

Use this command to display the MIB configuration for SNMPv3 view-based access (VACM).

show snmp view [*viewname*] [**subtree** *oid-or-mibobject*] [**volatile** | **nonvolatile** | **read-only**]

Syntax Description

<i>viewname</i>	(Optional) Displays information for a specific MIB view.
subtree <i>oid-or-mibobject</i>	(Optional) Displays information for a specific MIB subtree when <i>viewname</i> is specified.
volatile nonvolatile read-only	(Optional) Displays entries for a specific storage type.

Command Defaults

If no parameters are specified, all SNMP MIB view configuration information will be displayed.

Command Mode

Read-Only.

Example

This example shows how to display SNMP MIB view configuration information:

```
A2 (rw) ->show snmp view

--- SNMP MIB View information ---
View Name      = All
Subtree OID    = 1
Subtree mask   =
View Type      = included
Storage type   = nonVolatile
Row status     = active

View Name      = All
Subtree OID    = 0.0
Subtree mask   =
View Type      = included
Storage type   = nonVolatile
Row status     = active
```

View Name	= Network
Subtree OID	= 1.3.6.1.2.1
Subtree mask	=
View Type	= included
Storage type	= nonVolatile
Row status	= active

[Table 4-7](#) provides an explanation of the command output. For details on using the **set snmp view** command to assign variables, refer to [Section 4.3.4.3](#).

Table 4-7 show snmp view Output Details

Output	What It Displays...
View Name	Name assigned to a MIB view.
Subtree OID	Name identifying a MIB subtree.
Subtree mask	Bitmask applied to a MIB subtree.
View Type	Whether or not subtree use must be included or excluded for this view.
Storage type	Whether storage is in nonVolatile or Volatile memory.
Row status	Status of this entry: active , notInService , or notReady .

4.3.4.2 show snmp context

Use this command to display the context list configuration for SNMP's view-based access control. An SNMP context is a collection of management information that can be accessed by an SNMP agent or entity. The default context allows all SNMP agents to access all management information (MIBs). When created using the **set snmp access** command ([Section 4.3.3.2](#)), other contexts can be applied to limit access to a subset of management information.

show snmp context

Syntax Description

None.

Command Defaults

None.

Command Mode

Read-Only.

Example

This example shows how to display a list of all SNMP contexts known to the device:

```
A2 (rw) ->show snmp context

--- Configured contexts:
default context (all mibs)
```

4.3.4.3 set snmp view

Use this command to set a MIB configuration for SNMPv3 view-based access (VACM).

```
set snmp view viewname viewname subtree subtree [mask mask] [included |
excluded] [volatile | nonvolatile]
```

Syntax Description

viewname <i>viewname</i>	Specifies a name for a MIB view.
subtree <i>subtree</i>	Specifies a MIB subtree name.
mask <i>mask</i>	(Optional) Specifies a bitmask for a subtree.
included excluded	(Optional) Specifies subtree use (default) or no subtree use.
volatile nonvolatile	(Optional) Specifies the use of temporary or permanent (default) storage.

Command Defaults

- If not specified, **mask** will be set to **255.255.255.255**
- If not specified, subtree use will be **included**.
- If storage type is not specified, **nonvolatile** (permanent) will be applied.

Command Mode

Read-Write.

Example

This example shows how to set an SNMP MIB view to “public” with a subtree name of 1.3.6.1 included:

```
A2 (rw) ->set snmp view viewname public subtree 1.3.6.1 included
```

4.3.4.4 clear snmp view

Use this command to delete an SNMPv3 MIB view.

clear snmp view *viewname subtree*

Syntax Description

<i>viewname</i>	Specifies the MIB view name to be deleted.
<i>subtree</i>	Specifies the subtree name of the MIB view to be deleted.

Command Defaults

None.

Command Mode

Read-Write.

Example

This example shows how to delete SNMP MIB view “public”:

```
A2 (rw) ->clear snmp view public 1.3.6.1
```

4.3.5 Configuring SNMP Target Parameters

Purpose

To review and configure SNMP target parameters. This controls where and under what circumstances SNMP notifications will be sent. A target parameter entry can be bound to a target IP address allowed to receive SNMP notification messages with the **set snmp targetaddr** command ([Section 4.3.6.2](#)).

Commands

The commands used to review and configure SNMP target parameters are listed below and described in the associated section as shown.

- show snmp targetparams ([Section 4.3.5.1](#))
- set snmp targetparams ([Section 4.3.5.2](#))
- clear snmp targetparams ([Section 4.3.5.3](#))

4.3.5.1 show snmp targetparams

Use this command to display SNMP parameters used to generate a message to a target.

show snmp targetparams [*targetParams*] [**volatile** | **nonvolatile** | **read-only**]

Syntax Description

<i>targetParams</i>	(Optional) Displays entries for a specific target parameter.
volatile nonvolatile read-only	(Optional) Displays target parameter entries for a specific storage type.

Command Defaults

- If *targetParams* is not specified, entries associated with all target parameters will be displayed.
- If not specified, entries of all storage types will be displayed.

Command Mode

Read-Only.

Example

This example shows how to display SNMP target parameters information:

```
A2 (rw) -> show snmp targetparams

--- SNMP TargetParams information ---
Target Parameter Name   = v1ExampleParams
Security Name           = public
Message Proc. Model     = SNMPv1
Security Level           = noAuthNoPriv
Storage type            = nonVolatile
Row status              = active

Target Parameter Name   = v2cExampleParams
Security Name           = public
Message Proc. Model     = SNMPv2c
Security Level           = noAuthNoPriv
Storage type            = nonVolatile
Row status              = active
```

Target Parameter Name	= v3ExampleParams
Security Name	= CharliedChief
Message Proc. Model	= USM
Security Level	= authNoPriv
Storage type	= nonVolatile
Row status	= active

Table 4-8 shows a detailed explanation of the command output.

Table 4-8 show snmp targetparams Output Details

Output	What It Displays...
Target Parameter Name	Unique identifier for the parameter in the SNMP target parameters table. Maximum length is 32 bytes.
Security Name	Security string definition.
Message Proc. Model	SNMP version.
Security Level	Type of security level (auth : security level is set to use authentication protocol, noauth : security level is not set to use authentication protocol, or privacy).
Storage type	Whether entry is stored in volatile , nonvolatile or read-only memory.
Row status	Status of this entry: active , notInService , or notReady .

4.3.5.2 set snmp targetparams

Use this command to set SNMP target parameters, a named set of security/authorization criteria used to generate a message to a target.

```
set snmp targetparams paramsname user user security-model {v1 | v2c | usm}
message-processing {v1 | v2c | v3} [noauthentication | authentication | privacy]
[volatile | nonvolatile]
```

Syntax Description

<i>paramsname</i>	Specifies a name identifying parameters used to generate SNMP messages to a particular target.
user <i>user</i>	Specifies an SNMPv1 or v2 community name or an SNMPv3 user name. Maximum length is 32 bytes.
security-model v1 v2c usm	Specifies the SNMP security model applied to this target parameter as version 1, 2c or 3 (usm).
message-processing v1 v2c v3	Specifies the SNMP message processing model applied to this target parameter as version 1, 2c or 3.
noauthentication authentication privacy	(Optional) Specifies the SNMP security level applied to this target parameter as no authentication, authentication (without privacy) or privacy. Privacy specifies that messages sent on behalf of the user are protected from disclosure.
volatile nonvolatile	(Optional) Specifies the storage type applied to this target parameter.

Command Defaults

None.

- If not specified, security level will be set to **noauthentication**.
- If not specified, storage type will be set to **nonvolatile**.

Command Mode

Read-Write.

Example

This example shows how to set SNMP target parameters named “v1ExampleParams” for a user named “fred” using version 3 security model and message processing, and authentication:

```
A2 (rw) -> set snmp targetparams v1ExampleParams user fred security-model usm  
message-processing v3 authentication
```

4.3.5.3 clear snmp targetparams

Use this command to clear the SNMP target parameter configuration.

clear snmp targetparams *targetParams*

Syntax Description

<i>targetParams</i>	Specifies the name of the parameter in the SNMP target parameters table to be cleared.
---------------------	--

Command Defaults

None.

Command Mode

Read-Write.

Example

This example shows how to clear SNMP target parameters named “v1ExampleParams”:

```
A2 (rw) ->clear snmp targetparams v1ExampleParams
```

4.3.6 Configuring SNMP Target Addresses

Purpose

To review and configure SNMP target addresses which will receive SNMP notification messages. An address configuration can be linked to optional SNMP transmit, or target, parameters (such as timeout, retry count, and UDP port) set with the **set snmp targetparams** command ([Section 4.3.5.2](#)).

Commands

The commands used to review and configure SNMP target addresses are listed below and described in the associated section as shown.

- show snmp targetaddr ([Section 4.3.6.1](#))
- set snmp targetaddr ([Section 4.3.6.2](#))
- clear snmp targetaddr ([Section 4.3.6.3](#))

4.3.6.1 show snmp targetaddr

Use this command to display SNMP target address information.

show snmp targetaddr [*targetAddr*] [**volatile** | **nonvolatile** | **read-only**]

Syntax Description

<i>targetAddr</i>	(Optional) Displays information for a specific target address name.
volatile nonvolatile read-only	(Optional) When target address is specified, displays target address information for a specific storage type.

Command Defaults

- If *targetAddr* is not specified, entries for all target address names will be displayed.
- If not specified, entries of all storage types will be displayed for a target address.

Command Mode

Read-Only.

Example

This example shows how to display SNMP target address information:

```
A2(rw)->show snmp targetaddr
Target Address Name      = labmachine
Tag List                 = v2cTrap
IP Address               = 10.2.3.116
UDP Port#               = 162
Target Mask              = 255.255.255.255
Timeout                 = 1500
Retry count             = 4
Parameters              = v2cParams
Storage type            = nonVolatile
Row status              = active
```

[Table 4-9](#) shows a detailed explanation of the command output.

Table 4-9 show snmp targetaddr Output Details

Output	What It Displays...
Target Address Name	Unique identifier in the snmpTargetAddressTable.
Tag List	Tags a location to the target address as a place to send notifications.
IP Address	Target IP address.
UDP Port#	Number of the UDP port of the target host to use.
Target Mask	Target IP address mask.
Timeout	Timeout setting for the target address.
Retry count	Retry setting for the target address.
Parameters	Entry in the snmpTargetParamsTable.
Storage type	Whether entry is stored in volatile , nonvolatile , or read-only memory.
Row status	Status of this entry: active , notInService , or notReady .

4.3.6.2 set snmp targetaddr

Use this command to configure an SNMP target address. The target address is a unique identifier and a specific IP address that will receive SNMP notification messages and determine which community strings will be accepted. This address configuration can be linked to optional SNMP transmit parameters (such as timeout, retry count, and UDP port).

```
set snmp targetaddr targetaddr ipaddr param param [udpport udpport] [mask mask] [timeout timeout] [retries retries] [taglist taglist] [volatile | nonvolatile]
```

Syntax Description

<i>targetaddr</i>	Specifies a unique identifier to index the snmpTargetAddrTable. Maximum length is 32 bytes.
<i>ipaddr</i>	Specifies the IP address of the target.
param <i>param</i>	Specifies an entry in the SNMP target parameters table, which is used when generating a message to the target. Maximum length is 32 bytes.
udpport <i>udpport</i>	(Optional) Specifies which UDP port of the target host to use.
mask <i>mask</i>	(Optional) Specifies the IP mask of the target.
timeout <i>timeout</i>	(Optional) Specifies the maximum round trip time allowed to communicate to this target address. This value is in .01 seconds and the default is 1500 (15 seconds).
retries <i>retries</i>	(Optional) Specifies the number of message retries allowed if a response is not received. Default is 3.
taglist <i>taglist</i>	(Optional) Specifies a list of SNMP notify tag values. This tags a location to the target address as a place to send notifications. List must be enclosed in quotes and tag values must be separated by a space (i.e.: “tag 1 tag 2”)
volatile nonvolatile	(Optional) Specifies temporary (default), or permanent storage for SNMP entries.

Command Defaults

- If not specified, *udpport* will be set to **162**.
- If not specified, *mask* will be set to **255.255.255.255**.
- If not specified, *timeout* will be set to **1500**.

- If not specified, number of *retries* will be set to **3**.
- If **taglist** is not specified, none will be set.
- If not specified, storage type will be **nonvolatile**.

Command Mode

Read-Write.

Example

This example shows how to configure a trap notification called “TrapSink.” This trap notification will be sent to the workstation 192.168.190.80 (which is target address “tr”). It will use security and authorization criteria contained in a target parameters entry called “v2cExampleParams”. For more information on configuring a basic SNMP trap, refer to [Section 4.3.8](#):

```
A2 (rw) -> set snmp targetaddr tr 192.168.190.80 param v2cExampleParams taglist
TrapSink
```

4.3.6.3 clear snmp targetaddr

Use this command to delete an SNMP target address entry.

clear snmp targetaddr *targetAddr*

Syntax Description

<i>targetAddr</i>	Specifies the target address entry to delete.
-------------------	---

Command Defaults

None.

Command Mode

Read-Write.

Example

This example shows how to clear SNMP target address entry “tr”:

```
A2 (rw) ->clear snmp targetaddr tr
```

4.3.7 Configuring SNMP Notification Parameters

Purpose

To configure SNMP notification parameters and optional filters. Notifications are entities which handle the generation of SNMP v1 and v2 “traps” or SNMP v3 “informs” messages to select management targets. Optional notification filters identify which targets should not receive notifications. For a sample SNMP trap configuration showing how SNMP notification parameters are associated with security and authorization criteria (target parameters) and mapped to a management target address, refer to [Section 4.3.8](#).

Commands

The commands used to configure SNMP notification parameters and filters are listed below and described in the associated section as shown.

- show snmp notify ([Section 4.3.7.1](#))
- set snmp notify ([Section 4.3.7.2](#))
- clear snmp notify ([Section 4.3.7.3](#))
- show snmp notifyfilter ([Section 4.3.7.4](#))
- set snmp notifyfilter ([Section 4.3.7.5](#))
- clear snmp notifyfilter ([Section 4.3.7.6](#))
- show snmp notifyprofile ([Section 4.3.7.7](#))
- set snmp notifyprofile ([Section 4.3.7.8](#))
- clear snmp notifyprofile ([Section 4.3.7.9](#))

4.3.7.1 show snmp notify

Use this command to display the SNMP notify configuration, which determines which management targets will receive SNMP notifications.

show snmp notify [*notify*] [**volatile** | **nonvolatile** | **read-only**]

Syntax Description

<i>notify</i>	(Optional) Displays notify entries for a specific notify name.
volatile nonvolatile read-only	(Optional) Displays notify entries for a specific storage type.

Command Defaults

- If a *notify* name is not specified, all entries will be displayed.
- If **volatile**, **nonvolatile** or **read-only** are not specified, all storage type entries will be displayed.

Command Mode

Read-Only.

Example

This example shows how to display the SNMP notify information:

```
A2 (rw) ->show snmp notify

--- SNMP notifyTable information ---
Notify name      = 1
Notify Tag       = Console
Notify Type      = trap
Storage type     = nonVolatile
Row status       = active

Notify name      = 2
Notify Tag       = TrapSink
Notify Type      = trap
Storage type     = nonVolatile
Row status       = active
```

Table 4-10 shows a detailed explanation of the command output.

Table 4-10 show snmp notify Output Details

Output	What It Displays...
Notify name	A unique identifier used to index the SNMP notify table.
Notify Tag	Name of the entry in the SNMP notify table.
Notify Type	Type of notification: SNMPv1 or v2 trap or SNMPv3 InformRequest message.
Storage type	Whether access entry is stored in volatile , nonvolatile or read-only memory.
Row status	Status of this entry: active , notInService , or notReady .

4.3.7.2 set snmp notify

Use this command to set the SNMP notify configuration. This creates an entry in the SNMP notify table, which is used to select management targets who should receive notification messages. This command's **tag** parameter can be used to bind each entry to a target address using the **set snmp targetaddr** command (Section 4.3.6.2).

```
set snmp notify notify tag tag [trap | inform] [volatile | nonvolatile]
```

Syntax Description

<i>notify</i>	Specifies an SNMP notify name.
tag <i>tag</i>	Specifies an SNMP notify tag. This binds the notify name to the SNMP target address table.
trap inform	(Optional) Specifies SNMPv1 or v2 Trap messages (default) or SNMP v3 InformRequest messages.
volatile nonvolatile	(Optional) Specifies temporary (default), or permanent storage for SNMP entries.

Command Defaults

- If not specified, message type will be set to **trap**.
- If not specified, storage type will be set to **nonvolatile**.

Command Mode

Read-Write.

Example

This example shows how to set an SNMP notify configuration with a notify name of “hello” and a notify tag of “world”. Notifications will be sent as trap messages and storage type will automatically default to permanent:

```
A2 (rw) ->set snmp notify hello tag world trap
```

4.3.7.3 clear snmp notify

Use this command to clear an SNMP notify configuration.

clear snmp notify *notify*

Syntax Description

<i>notify</i>	Specifies an SNMP notify name to clear.
---------------	---

Command Defaults

None.

Command Mode

Read-Write.

Example

This example shows how to clear the SNMP notify configuration for “hello”:

```
A2 (rw) ->clear snmp notify hello
```

About SNMP Notify Filters

Profiles indicating which targets should not receive SNMP notification messages are kept in the NotifyFilter table. If this table is empty, meaning that no filtering is associated with any SNMP target, then no filtering will take place. “Traps” or “informs” notifications will be sent to all destinations in the SNMP targetAddrTable that have tags matching those found in the NotifyTable.

When the NotifyFilter table contains profile entries, the SNMP agent will find any filter profile name that corresponds to the target parameter name contained in an outgoing notification message. It will then apply the appropriate subtree-specific filter when generating notification messages.

4.3.7.4 show snmp notifyfilter

Use this command to display SNMP notify filter information, identifying which profiles will not receive SNMP notifications.

```
show snmp notifyfilter [profile] [subtree oid-or-mibobject] [volatile |
nonvolatile | read-only]
```

Syntax Description

<i>profile</i>	(Optional) Displays a specific notify filter.
subtree <i>oid-or-mibobject</i>	(Optional) Displays a notify filter within a specific subtree.
volatile nonvolatile read-only	(Optional) Displays notify filter entries of a specific storage type.

Command Defaults

If no parameters are specified, all notify filter information will be displayed.

Command Mode

Read-Only.

Example

This example shows how to display SNMP notify filter information. In this case, the notify profile “pilot1” in subtree 1.3.6 will not receive SNMP notification messages:

```
A2 (rw) ->show snmp notifyfilter

--- SNMP notifyFilter information ---
Profile           = pilot1
Subtree           = 1.3.6
Filter type       = included
Storage type      = nonVolatile
Row status        = active
```

4.3.7.5 set snmp notifyfilter

Use this command to create an SNMP notify filter configuration. This identifies which management targets should NOT receive notification messages, which is useful for fine-tuning the amount of SNMP traffic generated.

```
set snmp notifyfilter profile subtree oid-or-mibobject [mask mask] [included | excluded] [volatile | nonvolatile]
```

Syntax Description

<i>profile</i>	Specifies an SNMP filter notify name.
subtree <i>oid-or-mibobject</i>	Specifies a MIB subtree ID target for the filter.
mask <i>mask</i>	(Optional) Applies a subtree mask.
included excluded	(Optional) Specifies that subtree is included or excluded.
volatile nonvolatile	(Optional) Specifies a storage type.

Command Defaults

- If not specified, **mask** is not set.
- If not specified, subtree will be **included**.
- If storage type is not specified, **nonvolatile** (permanent) will be applied.

Command Mode

Read-Write.

Example

This example shows how to create an SNMP notify filter called “pilot1” with a MIB subtree ID of 1.3.6:

```
A2 (rw) ->set snmp notifyfilter pilot1 subtree 1.3.6
```

4.3.7.6 clear snmp notifyfilter

Use this command to delete an SNMP notify filter configuration.

clear snmp notifyfilter *profile subtree oid-or-mibobject*

Syntax Description

<i>profile</i>	Specifies an SNMP filter notify name to delete.
subtree <i>oid-or-mibobject</i>	Specifies a MIB subtree ID containing the filter to be deleted.

Command Defaults

None.

Command Mode

Read-Write.

Example

This example shows how to delete the SNMP notify filter “pilot1”:

A2 (rw) ->**clear snmp notifyfilter pilot1 subtree 1.3.6**

4.3.7.7 show snmp notifyprofile

Use this command to display SNMP notify profile information. This associates target parameters to an SNMP notify filter to determine who should not receive SNMP notifications.

```
show snmp notifyprofile [profile] [targetparam targetparam] [volatile |  
nonvolatile | read-only]
```

Syntax Description

<i>profile</i>	(Optional) Displays a specific notify profile.
targetparam <i>targetparam</i>	(Optional) Displays entries for a specific target parameter.
volatile nonvolatile read-only	(Optional) Displays notify filter entries of a specific storage type.

Command Defaults

If no parameters are specified, all notify profile information will be displayed.

Command Mode

Read-Only.

Example

This example shows how to display SNMP notify information for the profile named “area51”:

```
A2 (rw) -> show snmp notifyprofile area51  
  
--- SNMP notifyProfile information ---  
Notify Profile   = area51  
TargetParam     = v3ExampleParams  
Storage type    = nonVolatile  
Row status      = active
```

4.3.7.8 set snmp notifyprofile

Use this command to create an SNMP notify filter profile configuration. This associates a notification filter, created with the **set snmp notifyfilter** command ([Section 4.3.7.5](#)), to a set of SNMP target parameters to determine which management targets should not receive SNMP notifications.

```
set snmp notifyprofile profile targetparam targetparam [volatile | nonvolatile]
```

Syntax Description

<i>profile</i>	Specifies an SNMP filter notify name.
targetparam <i>targetparam</i>	Specifies an associated entry in the SNMP Target Params Table.
volatile nonvolatile	(Optional) Specifies a storage type.

Command Defaults

If storage type is not specified, **nonvolatile** (permanent) will be applied.

Command Mode

Read-Write.

Example

This example shows how to create an SNMP notify profile named area51 and associate a target parameters entry.

```
A2 (rw) ->set snmp notifyprofile area51 targetparam v3ExampleParams
```

4.3.7.9 clear snmp notifyprofile

Use this command to delete an SNMP notify profile configuration.

clear snmp notifyprofile *profile* **targetparam** *targetparam*

Syntax Description

<i>profile</i>	Specifies an SNMP filter notify name to delete.
targetparam <i>targetparam</i>	Specifies an associated entry in the snmpTargetParamsTable.

Command Defaults

None.

Command Mode

Read-Write.

Example

This example shows how to delete SNMP notify profile “area51”:

```
A2 (rw) ->clear snmp notifyprofile area51 targetparam v3ExampleParams
```

4.3.8 Creating a Basic SNMP Trap Configuration

Traps are notification messages sent by an SNMPv1 or v2 agent to a network management station, a console, or a terminal to indicate the occurrence of a significant event, such as when a port or device goes up or down, when there are authentication failures, and when power supply errors occur. The following configuration example shows how to use CLI commands to associate SNMP notification parameters with security and authorization criteria (target parameters), and map the parameters to a management target address.

NOTE: This example illustrates how to configure an SNMPv2 trap notification. Creating an SNMPv1 or v3 Trap, or an SNMPv3 Inform notification would require using the same commands with different parameters, where appropriate. Always ensure that v1/v2 communities or v3 users used for generating traps or informs are pre-configured with enough privileges to access corresponding MIBs.

Complete an SNMPv2 trap configuration on a SecureStack A2 device as follows:

1. Create a community name that will act as an SNMP user password.
2. Create an SNMP target parameters entry to associate security and authorization criteria to the users in the community created in Step 1.
3. Verify if any applicable SNMP notification entries exist, or create a new one. You will use this entry to send SNMP notification messages to the appropriate management targets created in Step 2.
4. Create a target address entry to bind a management IP address to
 - the notification entry and tag name created in Step 3, and
 - the target parameters entry created in Step 2.

Table 4-11 shows the commands used to complete an SNMPv2 trap configuration on a SecureStack A2 device.

Table 4-11 Basic SNMP Trap Configuration Command Set

To do this...	Use these commands...
Create a community name.	set snmp community (Section 4.3.2.8)
Create an SNMP target parameters entry.	set snmp targetparams (Section 4.3.5.2)
Verify if any applicable SNMP notification entries exist.	show snmp notify (Section 4.3.7.1)
Create a new notification entry.	set snmp notify (Section 4.3.7.2)

Table 4-11 Basic SNMP Trap Configuration Command Set (Continued)

To do this...	Use these commands...
Create a target address entry.	set snmp targetaddr (Section 4.3.6.2)

Example

This example shows how to:

- Create an SNMP community called **mgmt**.
- Configure a trap notification called **TrapSink**.

This trap notification will be sent with the community name **mgmt** to the workstation **192.168.190.80** (which is target address **tr**). It will use security and authorization criteria contained in a target parameters entry called **v2cExampleParams**.

```
A2 (rw) -> set snmp community mgmt
A2 (rw) -> set snmp targetparams v2cExampleParams user mgmt
security-model v2c message-processing v2c
A2 (rw) -> set snmp notify entry1 tag TrapSink
A2 (rw) -> set snmp targetaddr tr 192.168.190.80 param v2cExampleParams taglist
TrapSink
```

How SNMP Will Use This Configuration

In order to send a trap/notification requested by a MIB code, the SNMP agent requires the equivalent of a trap “door”, a “key” to unlock the door, and a “procedure” for crossing the doorstep. To determine if all these elements are in place, the SNMP agent proceeds as follows:

1. Determines if the “keys” for trap “doors” do exist. In the example configuration above, the key that SNMP is looking for is the notification entry created with the **set snmp notify** command which, in this case, is a key labeled **entry1**.
2. Searches for the doors matching such a key. For example, the parameters set for the **entry1** key shows that it opens only the door **TrapSink**.
3. Verifies that the specified door **TrapSink** is, in fact, available. In this case it was built using the **set snmp targetaddr** command. This command also specifies that this door leads to the management station **192.168.190.80**, and the “procedure” (**targetparams**) to cross the doorstep is called **v2ExampleParams**.
4. Verifies that the **v2ExampleParams** description of how to step through the door is, in fact, there. The agent checks **targetparams** entries and determines this description was made with

the **set snmp targetparams** command, which tells exactly which SNMP protocol to use and what community name to provide. In this case, the community name is **mgmt**.

5. Verifies that the **mgmt** community name is available. In this case, it has been configured using the **set snmp community** command.
6. Sends the trap notification message.

Spanning Tree Configuration

This chapter describes the Spanning Tree Configuration set of commands and how to use them.

5.1 SPANNING TREE CONFIGURATION SUMMARY

5.1.1 Overview: Single, Rapid, and Multiple Spanning Tree Protocols

The IEEE 802.1D Spanning Tree Protocol (STP) resolves the problems of physical loops in a network by establishing one primary path between any two devices in a network. Any duplicate paths are barred from use and become standby or blocked paths until the original path fails, at which point they can be brought into service.

RSTP

The IEEE 802.1w Rapid Spanning Protocol (RSTP), an evolution of 802.1D, can achieve much faster convergence than legacy STP in a properly configured network. RSTP significantly reduces the time to reconfigure the network's active topology when physical topology or configuration parameter changes occur. It selects one switch as the root of a Spanning Tree-connected active topology and assigns port roles to individual ports on the switch, depending on whether that port is part of the active topology.

RSTP provides rapid connectivity following the failure of a switch, switch port, or a LAN. A new root port and the designated port on the other side of the bridge transition to forwarding through an explicit handshake between them. By default, user ports are configured to rapidly transition to forwarding in RSTP.

MSTP

The IEEE 802.1s Multiple Spanning Tree Protocol (MSTP) builds upon 802.1D and RSTP by optimizing utilization of redundant links between switches in a network. When redundant links exist between a pair of switches running single STP, one link is forwarding while the others are

blocking for all traffic flowing between the two switches. The blocking links are effectively used only if the forwarding link goes down. MSTP assigns each VLAN present on the network to a particular Spanning Tree instance, allowing each switch port to be in a distinct state for each such instance: blocking for one Spanning Tree while forwarding for another. Thus, traffic associated with one set of VLANs can traverse a particular inter-switch link, while traffic associated with another set of VLANs can be blocked on that link. If VLANs are assigned to Spanning Trees wisely, no inter-switch link will be completely idle, maximizing network utilization.

For details on creating Spanning Tree instances, refer to [Section 5.2.1.12](#).

For details on mapping Spanning Tree instances to VLANs, refer to [Section 5.2.1.15](#).

NOTE: MSTP and RSTP are fully compatible and interoperable with each other and with legacy STP 802.1D.

5.1.2 Spanning Tree Features

The SecureStack A2 device meets the requirements of the Spanning Tree Protocols by performing the following functions:

- Creating a single Spanning Tree from any arrangement of switching or bridging elements.
- Compensating automatically for the failure, removal, or addition of any device in an active data path.
- Achieving port changes in short time intervals, which establishes a stable active topology quickly with minimal network disturbance.
- Using a minimum amount of communications bandwidth to accomplish the operation of the Spanning Tree Protocol.
- Reconfiguring the active topology in a manner that is transparent to stations transmitting and receiving data packets.
- Managing the topology in a consistent and reproducible manner through the use of Spanning Tree Protocol parameters.

5.1.3 Process Overview: Spanning Tree Configuration

CAUTION: Spanning Tree configuration should be performed only by personnel who are very knowledgeable about Spanning Trees and the configuration of the Spanning Tree Algorithm. Otherwise, the proper operation of the network could be at risk.

Use the following steps as a guide in the Spanning Tree configuration process:

1. Reviewing and setting Spanning Tree bridge (device) parameters ([Section 5.2.1](#))
2. Reviewing and setting Spanning Tree port parameters ([Section 5.2.2](#))

NOTE: The term “bridge” is used as an equivalent to the term “switch” or “device” in this document.

5.2 SPANNING TREE CONFIGURATION COMMAND SET

5.2.1 Reviewing and Setting Spanning Tree Bridge Parameters

Purpose

To display and set Spanning Tree bridge parameters, including device priorities, hello time, maximum wait time, forward delay, path cost, and topology change trap suppression.

Commands

The commands used to review and set Spanning Tree bridge parameters are listed below and described in the associated section as shown.

- show spantree stats ([Section 5.2.1.1](#))
- set spantree ([Section 5.2.1.2](#))
- show spantree version ([Section 5.2.1.3](#))
- set spantree version ([Section 5.2.1.4](#))
- clear spantree version ([Section 5.2.1.5](#))
- show spantree bpdu-forwarding ([Section 5.2.1.6](#))
- set spantree bpdu-forwarding ([Section 5.2.1.7](#))

- show spantree bridgeprioritymode ([Section 5.2.1.8](#))
- set spantree bridgeprioritymode ([Section 5.2.1.9](#))
- clear spantree bridgeprioritymode ([Section 5.2.1.10](#))
- show spantree mstlist ([Section 5.2.1.11](#))
- set spantree msti ([Section 5.2.1.12](#))
- clear spantree msti ([Section 5.2.1.13](#))
- show spantree mstmap ([Section 5.2.1.14](#))
- set spantree mstmap ([Section 5.2.1.15](#))
- clear spantree mstmap ([Section 5.2.1.16](#))
- show spantree vlanlist ([Section 5.2.1.17](#))
- show spantree mstcfigid ([Section 5.2.1.18](#))
- set spantree mstcfigid ([Section 5.2.1.19](#))
- clear spantree mstcfigid ([Section 5.2.1.20](#))
- set spantree priority ([Section 5.2.1.21](#))
- clear spantree priority ([Section 5.2.1.22](#))
- set spantree hello ([Section 5.2.1.23](#))
- clear spantree hello ([Section 5.2.1.24](#))
- set spantree maxage ([Section 5.2.1.25](#))
- clear spantree maxage ([Section 5.2.1.26](#))
- set spantree fwddelay ([Section 5.2.1.27](#))
- clear spantree fwddelay ([Section 5.2.1.28](#))
- show spantree backuproot ([Section 5.2.1.29](#))
- set spantree backuproot ([Section 5.2.1.30](#))
- clear spantree backuproot ([Section 5.2.1.31](#))
- show spantree tctrapsuppress ([Section 5.2.1.32](#))
- set spantree tctrapsuppress ([Section 5.2.1.33](#))
- clear spantree tctrapsuppress ([Section 5.2.1.34](#))
- set spantree protomigration ([Section 5.2.1.35](#))

- show spantree spanguard ([Section 5.2.1.36](#))
- set spantree spanguard ([Section 5.2.1.37](#))
- clear spantree spanguard ([Section 5.2.1.38](#))
- show spantree spanguardtimeout ([Section 5.2.1.39](#))
- set spantree spanguardtimeout ([Section 5.2.1.40](#))
- clear spantree spanguardtimeout ([Section 5.2.1.41](#))
- show spantree spanguardlock ([Section 5.2.1.42](#))
- clear / set spantree spanguardlock ([Section 5.2.1.43](#))
- show spantree spanguardtrapenable ([Section 5.2.1.44](#))
- set spantree spanguardtrapenable ([Section 5.2.1.45](#))
- clear spantree spanguardtrapenable ([Section 5.2.1.46](#))

5.2.1.1 show spantree stats

Use this command to display Spanning Tree information for one or more ports.

```
show spantree stats [port port-string] [sid sid] [active]
```

Syntax Description

port <i>port-string</i>	(Optional) Displays information for the specified port(s). For a detailed description of possible <i>port-string</i> values, refer to Section 3.1.1 .
sid <i>sid</i>	(Optional) Displays information for a specific Spanning Tree identifier. If not specified, SID 0 is assumed.
active	(Optional) Displays information for ports that have received STP BPDUs since boot.

Command Defaults

- If *port-string* is not specified, Spanning Tree information for all ports will be displayed.
- If *sid* is not specified, information for Spanning Tree 0 will be displayed.
- If **active** is not specified information for all ports will be displayed regardless of whether or not they have received BPDUs.

Command Mode

Read-Only.

Example

This example shows how to display the device's Spanning Tree configuration:

```
A2(rw)->show spantree stats

Spanning tree status           - enabled
Spanning tree instance        - 0
Designated Root MacAddr       - 00-e0-63-9d-c1-c8
Designated Root Priority       - 0
Designated Root Cost          - 10000
Designated Root Port          - lag.0.1
Root Max Age                   - 20 sec
Root Hello Time                - 2 sec
Root Forward Delay             - 15 sec
Bridge ID MAC Address          - 00-01-f4-da-5e-3d
Bridge ID Priority             - 32768
Bridge Max Age                 - 20 sec
Bridge Hello Time              - 2 sec
Bridge Forward Delay           - 15 sec
Topology Change Count         - 7
Time Since Top Change         - 00 days 03:19:15
Max Hops                       - 20
```

[Table 5-1](#) shows a detailed explanation of command output.

Table 5-1 show spantree Output Details

Output	What It Displays...
Spanning tree status	Whether Spanning Tree is enabled or disabled.
Spanning tree instance	Spanning Tree ID.
Designated Root MacAddr	MAC address of the designated Spanning Tree root bridge.
Designated Root Priority	Priority of the designated root bridge.
Designated Root Cost	Total path cost to reach the root.
Designated Root Port	Port through which the root bridge can be reached.
Root Max Age	Amount of time (in seconds) a BPDU packet should be considered valid.
Root Hello Time	Interval (in seconds) at which the root device sends BPDU (Bridge Protocol Data Unit) packets.
Root Forward Delay	Amount of time (in seconds) the root device spends in listening or learning mode.

Table 5-1 show spantree Output Details (Continued)

Output	What It Displays...
Bridge ID MAC Address	Unique bridge MAC address, recognized by all bridges in the network.
Bridge ID Priority	Bridge priority, which is a default value, or is assigned using the set spantree priority command. For details, refer to Section 5.2.1.21 .
Bridge Max Age	Maximum time (in seconds) the bridge can wait without receiving a configuration message (bridge “hello”) before attempting to reconfigure. This is a default value, or is assigned using the set spantree maxage command. For details, refer to Section 5.2.1.25 .
Bridge Hello Time	Amount of time (in seconds) the bridge sends BPDUs. This is a default value, or is assigned using the set spantree hello command. For details, refer to Section 5.2.1.23 .
Bridge Forward Delay	Amount of time (in seconds) the bridge spends in listening or learning mode. This is a default value, or is assigned using the set spantree fwdldelay command. For details, refer to Section 5.2.1.27 .
Topology Change Count	Number of times topology has changed on the bridge.
Time Since Top Change	Amount of time (in days, hours, minutes and seconds) since the last topology change.
Max Hops	Maximum number of hops information for a particular Spanning Tree instance may traverse (via relay of BPDUs within the applicable MST region) before being discarded.

5.2.1.2 **set spantree**

Use this command to globally enable or disable the Spanning Tree protocol on the switch.

set spantree {disable | enable}

Syntax Description

disable enable	Globally disables or enables Spanning Tree.
-------------------------	---

Command Defaults

None.

Command Mode

Read-Write.

Example

This example shows how to disable Spanning Tree on the device:

```
A2 (rw) -> set spantree disable
```

5.2.1.3 **show spantree version**

Use this command to display the current version of the Spanning Tree protocol running on the device.

show spantree version

Syntax Description

None.

Command Defaults

None.

Command Mode

Read-Only.

Example

This example shows how to display Spanning Tree version information for the device:

```
A2 (rw) -> show spantree version  
Force Version is mstp
```

5.2.1.4 set spantree version

Use this command to set the version of the Spanning Tree protocol to MSTP (Multiple Spanning Tree Protocol), RSTP (Rapid Spanning Tree Protocol) or to STP 802.1D-compatible.

set spantree version {mstp | stpcompatible | rstp}

NOTE: In most networks, Spanning Tree version should not be changed from its default setting of **mstp** (Multiple Spanning Tree Protocol) mode. MSTP mode is fully compatible and interoperable with legacy STP 802.1D and Rapid Spanning Tree (RSTP) bridges. Setting the version to **stpcompatible** mode will cause the bridge to transmit only 802.1D BPDUs, and will prevent non-edge ports from rapidly transitioning to forwarding state.

Syntax Description

mstp	Sets the version to STP 802.1s-compatible.
stpcompatible	Sets the version to STP 802.1D-compatible.
rstp	Sets the version to 802.1w-compatible.

Command Defaults

None.

Command Mode

Read-Write.

Example

This example shows how to globally change the Spanning Tree version from the default of MSTP to RSTP:

```
A2 (rw) -> set spantree version rstp
```

5.2.1.5 **clear spantree version**

Use this command to reset the Spanning Tree version to MSTP mode.

clear spantree version

Syntax Description

None.

Command Defaults

None.

Command Mode

Read-Write.

Example

This example shows how to reset the Spanning Tree version:

```
A2 (rw) ->clear spantree version
```

5.2.1.6 **show spantree bpdu-forwarding**

Use this command to display the Spanning Tree BPDU forwarding mode.

show spantree bpdu-forwarding

Syntax Description

None.

Command Defaults

None.

Command Mode

Read-Only.

Example

This example shows how to display the Spanning Tree BPDU forwarding mode:

```
A2(su)->show spantree bpdu-forwarding  
BPDU forwarding is disabled.
```

5.2.1.7 set spantree bpdu-forwarding

Use this command to set the Spanning Tree BPDU forwarding to enable or disable. By default BPDU forwarding is disabled.

NOTE: The Spanning Tree protocol must be disabled (**set spantree disable**) for this feature to take effect.

set spantree bpdu-forwarding {disable | enable}

Syntax Description

disable enable	Sets BPDU forwarding to enabled or disabled.
-------------------------	--

Command Defaults

None.

Command Mode

Read-Write.

Example

This example shows how to enable BPDU forwarding:

```
A2 (su) -> set spantree bpdu-forwarding enable
```

5.2.1.8 **show spantree bridgeprioritymode**

Use this command to display the Spanning Tree bridge priority mode setting.

show spantree bridgeprioritymode

Syntax Description

None.

Command Defaults

None.

Command Mode

Read-Only.

Example

This example shows how to display the Spanning Tree bridge priority mode setting:

```
A2(rw)->show spantree bridgeprioritymode  
Bridge Priority Mode is set to IEEE802.1t mode.
```

5.2.1.9 set spantree bridgeprioritymode

Use this command to set the Spanning Tree bridge priority mode to 802.1D (legacy) or 802.1t. The mode affects the range of priority values used to determine which device is selected as the Spanning Tree root as described in set **spantree priority** ([Section 5.2.1.21](#)). The default for the switch is to use 802.1t bridge priority mode.

```
set spantree bridgeprioritymode {8021d | 8021t}
```

Syntax Description

8021d	Sets the bridge priority mode to use 802.1D (legacy) values, which are 0 to 65535.
8021t	Sets the bridge priority mode to use 802.1t values, which are 0 to 61440, in increments of 4096. Values will automatically be rounded up or down, depending on the 802.1t value to which the entered value is closest. This is the default bridge priority mode.

Command Defaults

None.

Command Mode

Read-Write.

Example

This example shows how to set the bridge priority mode to 802.1D:

```
A2 (rw) ->set spantree bridgeprioritymode 8021d
```

5.2.1.10 **clear spantree bridgeprioritymode**

Use this command to reset the Spanning Tree bridge priority mode to the default setting of 802.1t.

clear spantree bridgeprioritymode

Syntax Description

None.

Command Defaults

None.

Command Mode

Read-Write.

Example

This example shows how to reset the bridge priority mode to 802.1t:

```
A2 (rw) ->clear spantree bridgeprioritymode
```

5.2.1.11 **show spantree mstlist**

Use this command to display a list of Multiple Spanning Tree (MST) instances configured on the device.

show spantree mstlist

Syntax Description

None.

Command Defaults

None.

Command Mode

Read-Only.

Example

This example shows how to display a list of MST instances. In this case, SID 2 has been configured:

```
A2 (rw) -> show spantree mstlist  
Configured Multiple Spanning Tree instances:  
2
```

5.2.1.12 set spantree msti

Use this command to create or delete a Multiple Spanning Tree instance.

```
set spantree msti sid sid {create | delete}
```

Syntax Description

sid sid	Sets the Multiple Spanning Tree ID. Valid values are 1 - 4094 .
<div> NOTE: SecureStack A2 devices will support up to 4 MST instances.</div>	
create delete	Creates or deletes an MST instance.

Command Defaults

None.

Command Mode

Read-Write.

Example

This example shows how to create an MST instance 2:

```
A2 (rw) ->set spantree msti sid 2 create
```

5.2.1.13 clear spantree msti

Use this command to delete one or more Multiple Spanning Tree instances.

clear spantree msti [*sid sid*]

Syntax Description

sid <i>sid</i>	(Optional) Deletes a specific multiple Spanning Tree ID.
-----------------------	--

Command Defaults

If *sid* is not specified, all MST instances will be cleared.

Command Mode

Read-Write.

Example

This example shows how to delete all MST instances:

```
A2 (rw) ->clear spantree msti
```

5.2.1.14 show spantree mstmap

Use this command to display the mapping of a filtering database ID (FID) to Spanning Trees. Since VLANs are mapped to FIDs, this shows to which SID a VLAN is mapped.

show spantree mstmap [*fid fid*]

Syntax Description

fid fid	(Optional) Displays information for specific FIDs.
----------------	--

Command Defaults

If *fid* is not specified, information for all assigned FIDs will be displayed.

Command Mode

Read-Only.

Example

This example shows how to display SID to FID mapping information for FID 1. In this case, no new mappings have been configured:

```
A2 (rw) ->show spantree mstmap fid 1
FID:      SID:
1         0
```

5.2.1.15 set spantree mstmap

Use this command to map one or more filtering database IDs (FIDs) to a SID. Since VLANs are mapped to FIDs, this essentially maps one or more VLAN IDs to a Spanning Tree (SID).

```
set spantree mstmap fid [sid sid]
```

Syntax Description

<i>fid</i>	Specifies one or more FIDs to assign to the MST. Valid values are 1 - 4093 , and must correspond to a VLAN ID created using the set vlan command as described in Section 6.3.2.1 .
sid <i>sid</i>	(Optional) Specifies a Multiple Spanning Tree ID. Valid values are 1 - 4094 , and must correspond to a SID created using the set msti command as described in Section 5.2.1.12 .

Command Defaults

If *sid* is not specified, FID(s) will be mapped to Spanning Tree 0.

Command Mode

Read-Write.

Example

This example shows how to map FID 3 to SID 2:

```
A2 (rw) ->set spantree mstmap 3 sid 2
```

5.2.1.16 clear spantree mstmap

Use this command to map a FID back to SID 0.

clear spantree mstmap *fid*

Syntax Description

<i>fid</i>	Specifies one or more FIDs to reset to 0.
------------	---

Command Defaults

If *fid* is not specified, all SID to FID mappings will be reset.

Command Mode

Read-Write.

Example

This example shows how to map FID 2 back to SID 0:

```
A2 (rw) ->clear spantree mstmap 2
```

5.2.1.17 show spantree vlanlist

Use this command to display the Spanning Tree ID(s) assigned to one or more VLANs.

show spantree vlanlist [*vlan-list*]

Syntax Description

<i>vlan-list</i>	(Optional) Displays SIDs assigned to specific VLAN(s).
------------------	--

Command Defaults

If not specified, SID assignment will be displayed for all VLANs.

Command Mode

Read-Only.

Example

This example shows how to display the SIDs mapped to VLAN 1. In this case, SIDs 2, 16 and 42 are mapped to VLAN 1. For this information to display, the SID instance must be created using the **set spantree msti** command as described in [Section 5.2.1.12](#), and the FIDs must be mapped to SID 1 using the **set spantree mstmap** command as described in [Section 5.2.1.15](#):

```
A2 (rw) -> show spantree vlanlist 1  
The following SIDS are assigned to VLAN 1: 2 16 42
```

5.2.1.18 **show spantree mstcfgid**

Use this command to display the MST configuration identifier elements, including format selector, configuration name, revision level, and configuration digest.

show spantree mstcfgid

Syntax Description

None.

Command Defaults

None.

Command Mode

Read-Only.

Example

This example shows how to display the MST configuration identifier elements. In this case, the default revision level of 0, and the default configuration name (a string representing the bridge MAC address) have not been changed. For information on using the **set spantree mstcfgid** command to change these settings, refer to [Section 5.2.1.19](#):

```
A2 (rw) -> show spantree mstcfgid
MST Configuration Identifier:
  Format Selector: 0
  Configuration Name: 00:01:f4:89:51:94
  Revision Level: 0
  Configuration Digest: ac:36:17:7f:50:28:3c:d4:b8:38:21:d8:ab:26:de:62
```

5.2.1.19 set spantree mstcfgid

Use this command to set the MST configuration name and/or revision level.

```
set spantree mstcfgid {cfgname name | rev level}
```

Syntax Description

cfgname <i>name</i>	Specifies an MST configuration name.
rev <i>level</i>	Specifies an MST revision level. Valid values are 0 - 65535 .

Command Defaults

None.

Command Mode

Read-Write.

Example

This example shows how to set the MST configuration name to “mstconfig”:

```
A2 (rw) -> set spantree mstconfigid cfgname mstconfig
```

5.2.1.20 **clear spantree mstcfgid**

Use this command to reset the MST revision level to a default value of 0, and the configuration name to a default string representing the bridge MAC address.

clear spantree mstcfgid

Syntax Description

None.

Command Defaults

None.

Command Mode

Read-Write.

Example

This example shows how to reset the MST configuration identifier elements to default values:

```
A2 (rw) ->clear spantree mstcfgid
```

5.2.1.21 set spantree priority

Use this command to set the device’s Spanning Tree priority. The device with the highest priority (lowest numerical value) becomes the Spanning Tree root device. If all devices have the same priority, the device with the lowest MAC address will then become the root device. Depending on the bridge priority mode (set with **set spantree bridgeprioritymode** command described in [Section 5.2.1.9](#)), some priority values may rounded up or down.

```
set spantree priority priority [sid]
```

Syntax Description

<i>priority</i>	Specifies the priority of the bridge. Valid values are from 0 to 61440 (in increments of 4096), with 0 indicating highest priority and 61440 lowest priority.
<i>sid</i>	(Optional) Sets the priority on a specific Spanning Tree. Valid values are 0 - 4094 . If not specified, SID 0 is assumed.

Command Defaults

If *sid* is not specified, priority will be set on Spanning Tree 0.

Command Mode

Read-Write.

Example

This example shows how to set the bridge priority to 4096 on SID 1:

```
A2 (rw) ->set spantree priority 4096 1
```

5.2.1.22 clear spantree priority

Use this command to reset the Spanning Tree priority to the default value of 32768.

clear spantree priority [*sid*]

Syntax Description

<i>sid</i>	(Optional) Resets the priority on a specific Spanning Tree. Valid values are 0 - 4094 . If not specified, SID 0 is assumed.
------------	--

Command Defaults

If *sid* is not specified, priority will be reset on Spanning Tree 0.

Command Mode

Read-Write.

Example

This example shows how to reset the bridge priority on SID 1:

```
A2 (rw) ->clear spantree priority 1
```

5.2.1.23 set spantree hello

Use this command to set the device’s Spanning Tree hello time, This is the time interval (in seconds) the device will transmit BPDUs indicating it is active.

set spantree hello *interval*

Syntax Description

<i>interval</i>	Specifies the number of seconds the system waits before broadcasting a bridge hello message (a multicast message indicating that the system is active). Valid values are 1 - 10 .
-----------------	--

Command Defaults

None.

Command Mode

Read-Write.

Example

This example shows how to globally set the Spanning Tree hello time to 10 seconds:

```
A2 (rw) ->set spantree hello 10
```

5.2.1.24 **clear spantree hello**

Use this command to reset the Spanning Tree hello time to the default value of 2 seconds.

clear spantree hello

Syntax Description

None.

Command Defaults

None.

Command Mode

Read-Write.

Example

This example shows how to globally reset the Spanning Tree hello time:

```
A2 (rw) ->clear spantree hello
```

5.2.1.25 set spantree maxage

Use this command to set the bridge maximum aging time. This is the maximum time (in seconds) a device can wait without receiving a configuration message (bridge “hello”) before attempting to reconfigure. All device ports (except for designated ports) should receive configuration messages at regular intervals. Any port that ages out STP information provided in the last configuration message becomes the designated port for the attached LAN. If it is a root port, a new root port is selected from among the device ports attached to the network.

set spantree maxage *agingtime*

Syntax Description

<i>agingtime</i>	Specifies the maximum number of seconds that the system retains the information received from other bridges through STP. Valid values are 6 - 40 .
------------------	---

Command Defaults

None.

Command Mode

Read-Write.

Example

This example shows how to set the maximum aging time to 25 seconds:

```
A2 (rw) -> set spantree maxage 25
```

5.2.1.26 **clear spantree maxage**

Use this command to reset the maximum aging time for a Spanning Tree to the default value of 20 seconds.

clear spantree maxage

Syntax Description

None.

Command Defaults

None.

Command Mode

Read-Write.

Example

This example shows how to globally reset the maximum aging time:

```
A2 (rw) ->clear spantree maxage
```

5.2.1.27 set spantree fwddelay

Use this command to set the Spanning Tree forward delay. This is the maximum time (in seconds) the root device will wait before changing states (i.e., listening to learning to forwarding). This delay is required because every device must receive information about topology changes before it starts to forward frames. In addition, each port needs time to listen for conflicting information that would make it return to a blocking state; otherwise, temporary data loops might result.

set spantree fwddelay *delay*

Syntax Description

<i>delay</i>	Specifies the number of seconds for the bridge forward delay. Valid values are 4 - 30 .
--------------	--

Command Defaults

None.

Command Mode

Read-Write.

Example

This example shows how to globally set the bridge forward delay to 16 seconds:

```
A2 (rw) -> set spantree fwddelay 16
```

5.2.1.28 **clear spantree fwddelay**

Use this command to reset the Spanning Tree forward delay to the default setting of 15 seconds.

clear spantree fwddelay

Syntax Description

None.

Command Defaults

None.

Command Mode

Read-Write.

Example

This example shows how to globally reset the bridge forward delay:

```
A2 (rw) ->clear spantree fwddelay
```

5.2.1.29 **show spantree backuproot**

Use this command to display the backup root status for an MST instance.

show spantree backuproot [*sid*]

Syntax Description

<i>sid</i>	(Optional) Display backup root status for a specific Spanning Tree identifier. Valid values are 0 - 4094 . If not specified, SID 0 is assumed.
------------	---

Command Defaults

If a SID is not specified then status will be shown for Spanning Tree instance 0.

Command Mode

Read-Only.

Example

This example shows how to display the status of the backup root function on SID 0:

```
A2 (rw) -> show spantree backuproot  
Backup root is set to disable on sid 0
```

5.2.1.30 set spantree backuproot

Use this command to enable or disable the Spanning Tree backup root function on the switch. This feature is disabled by default on the SecureStack A2. When this feature is enabled and the A2 is directly connected to the root bridge, stale Spanning Tree information is prevented from circulating if the root bridge is lost. If the root bridge is lost, the backup root will dynamically lower its bridge priority so that it will be selected as the new root over the lost root bridge.

set spantree backuproot *sid* {disable | enable}

Syntax Description

<i>sid</i>	Specifies the Spanning Tree instance on which to enable or disable the backup root function. Valid values are 0 - 4094 .
disable enable	Enables or disables the backup root function.

Command Defaults

None.

Command Mode

Read-Write.

Example

This example shows how to enable the backup root function on SID 2:

```
A2 (rw) -> set spantree backuproot 2 enable
```

5.2.1.31 clear spantree backuproot

Use this command to reset the Spanning Tree backup root function to the default state of disabled.

clear spantree backuproot *sid*

Syntax Description

<i>sid</i>	Specifies the Spanning Tree on which to clear the backup root function.Valid values are 0 - 4094 .
------------	---

Command Defaults

None.

Command Mode

Read-Write.

Example

This example shows how to reset the backup root function to disabled on SID 2:

```
A2 (rw) ->clear spantree backuproot 2
```

5.2.1.32 **show spantree tctrapsuppress**

Use this command to display the status of topology change trap suppression on Rapid Spanning Tree edge ports.

show spantree tctrapsuppress

Syntax Description

None.

Command Defaults

None.

Command Mode

Read-Only.

Example

This example shows how to display the status of topology change trap suppression:

```
A2 (rw) -> show spantree tctrapsuppress
```

```
Topology change Trap Suppression is set to enabled
```

5.2.1.33 set spantree tctrapsuppress

Use this command to disable or enable topology change trap suppression on Rapid Spanning Tree edge ports. By default, RSTP non-edge (bridge) ports that transition to forwarding or blocking cause the switch to issue a topology change trap. When topology change trap suppression is enabled, which is the device default, edge ports (such as end station PCs) are prevented from sending topology change traps. This is because there is usually no need for network management to monitor edge port STP transition states, such as when PCs are powered on. When topology change trap suppression is disabled, all ports, including edge and bridge ports, will transmit topology change traps.

set spantree tctrapsuppress {disable | enable}

Syntax Description

disable enable	Disables or enables topology change trap suppression.
-------------------------	---

Command Defaults

None.

Command Mode

Read-Write.

Example

This example shows how to allow Rapid Spanning Tree edge ports to transmit topology change traps:

```
A2 (rw) ->set spantree tctrapsuppress disable
```

5.2.1.34 **clear spantree tctrapsuppress**

Use this command to clear the status of topology change trap suppression on Rapid Spanning Tree edge ports to the default state of enabled (edge port topology changes do not generate traps).

clear spantree tctrapsuppress

Syntax Description

None.

Command Defaults

None.

Command Mode

Read-Write.

Example

This example shows how to clear topology change trap suppression setting:

```
A2 (rw) ->clear spantree tctrapsuppress
```

5.2.1.35 set spantree protomigration

Use this command to reset the protocol state migration machine for one or more Spanning Tree ports. When operating in RSTP mode, this forces a port to transmit MSTP BPDUs.

set spantree protomigration <*port-string*>

Syntax Description

<i>port-string</i>	Reset the protocol state migration machine for specific port(s). For a detailed description of possible <i>port-string</i> values, refer to Section 3.1.1 .
--------------------	---

Command Defaults

None.

Command Mode

Read-Write.

Example

This example shows how to reset the protocol state migration machine on port 20:

```
A2 (su) ->set spantree protomigration ge.1.20
```

5.2.1.36 **show spantree spanguard**

Use this command to display the status of the Spanning Tree span guard function.

show spantree spanguard

Syntax Description

None.

Command Defaults

None.

Command Mode

Read-Only.

Example

This example shows how to display the span guard function status:

```
A2(ro)->show spantree spanguard  
Spanguard is disabled
```

5.2.1.37 set spantree spanguard

Use this command to enable or disable the Spanning Tree span guard function. Span guard is designed to disable, or lock out an "edge" port when an unexpected BPDU is received. The port can be configured to be re-enabled after a set time period, or only after manual intervention.

A port can be defined as an edge (user) port using the **set spantree adminedge** command, described in [Section 5.2.2.11](#). A port designated as an edge port is expected to be connected to a workstation or other end-user type of device, and not to another switch in the network. When Spanguard is enabled, if a non-loopback BPDU is received on an edge port, the Spanning Tree state of that port will be changed to "blocking" and will no longer forward traffic. The port will remain disabled until the amount of time defined by **set spantree spanguardtimeout** ([Section 5.2.1.40](#)) has passed since the last seen BPDU, the port is manually unlocked (**set** or **clear spantree spanguardlock**, [Section 5.2.1.43](#)), the configuration of the port is changed so it is not longer an edge port, or the span guard function is disabled.

Span guard is enabled and disabled only on a global basis across the stack. By default, span guard is disabled and span guard traps are enabled.

set spantree spanguard {enable | disable}

Syntax Description

enable disable	Enables or disables the span guard function.
-------------------------	--

Command Defaults

None.

Command Mode

Read-Write.

Example

This example shows how to enable the span guard function:

```
A2 (rw) -> set spantree spanguard enable
```

5.2.1.38 **clear spantree spanguard**

Use this command to reset the status of the Spanning Tree span guard function to disabled.

clear spantree spanguard

Syntax Description

None.

Command Defaults

None.

Command Mode

Read-Write.

Example

This example shows how to reset the status of the span guard function to disabled:

```
A2 (rw) ->clear spantree spanguard
```

5.2.1.39 **show spantree spanguardtimeout**

Use this command to display the Spanning Tree span guard timeout setting.

show spantree spanguardtimeout

Syntax Description

None.

Command Defaults

None.

CCommand Mode

Read-Only.

Example

This example shows how to display the span guard timeout setting:

```
A2(su)->show spantree spanguardtimeout  
Spanguard timeout: 300
```

5.2.1.40 set spantree spanguardtimeout

Use this command to set the amount of time (in seconds) an edge port will remain locked by the span guard function.

set spantree spanguardtimeout *timeout*

Syntax Description

<i>timeout</i>	Specifies a timeout value in seconds. Valid values are 0 to 65535 . A value of 0 will keep the port locked until manually unlocked. The default value is 300 seconds.
----------------	--

Command Defaults

None.

Command Mode

Read-Write.

Example

This example shows how to set the span guard timeout to 600 seconds:

```
A2 (rw) -> set spantree spanguardtimeout 600
```

5.2.1.41 clear spantree spanguardtimeout

Use this command to reset the Spanning Tree span guard timeout to the default value of 300 seconds.

clear spantree spanguardtimeout

Syntax Description

None.

Command Defaults

None.

Command Mode

Read-Write.

Example

This example shows how to reset the span guard timeout to 300 seconds:

```
A2 (rw) ->clear spantree spanguardtimeout
```

5.2.1.42 show spantree spanguardlock

Use this command to display the span guard lock status of one or more ports.

show spantree spanguardlock [*port-string*]

Syntax Description

<i>port-string</i>	(Optional) Specifies the port(s) for which to show span guard lock status. For a detailed description of possible <i>port-string</i> values, refer to Section 3.1.1 .
--------------------	---

Command Defaults

If no port string is specified, the span guard lock status for all ports is displayed.

Command Mode

Read-Only.

Example

This example shows how to display the span guard lock status for fe.1.1:

```
A2 (su) -> show spantree spanguardlock fe.1.1
Port fe.1.1 is Unlocked
```

5.2.1.43 clear / set spantree spanguardlock

Use either of these commands to unlock one or more ports locked by the Spanning Tree span guard function. When span guard is enabled, it locks ports that receive BPDUs when those ports have been defined as edge (user) ports (as described in [Section 5.2.2.11](#)).

```
clear spantree spanguardlock port-string
set spantree spanguardlock port-string
```

Syntax Description

<i>port-string</i>	Specifies port(s) to unlock. For a detailed description of possible <i>port-string</i> values, refer to Section 3.1.1 .
--------------------	---

Command Defaults

None.

Command Mode

Read-Write.

Example

This example shows how to unlock port fe.1.16:

```
A2 (rw) ->clear spantree spanguardlock fe.1.16
```

5.2.1.44 **show spantree spanguardtrapenable**

Use this command to display the state of the Spanning Tree span guard trap function.

show spantree spanguardtrapenable

Syntax Description

None.

Command Defaults

None.

Command Mode

Read-Only.

Example

This example shows how to display the state of the span guard trap function:

```
A2(ro)->show spantree spanguardtrapenable  
Spanguard SNMP traps are enabled
```

5.2.1.45 **set spantree spanguardtrapenable**

Use this command to enable or disable the sending of an SNMP trap message when span guard has locked a port.

set spantree spanguardtrapenable {disable | enable}

Syntax Description

disable enable	Disables or enables sending span guard traps. By default, sending traps is enabled.
-------------------------	---

Command Defaults

None.

Command Mode

Read-Write.

Example

This example shows how to disable the span guard trap function:

```
A2 (rw) ->set spantree spanguardtrapenable disable
```

5.2.1.46 **clear spantree spanguardtrapenable**

Use this command to reset the Spanning Tree span guard trap function back to the default state of enabled.

clear spantree spanguardtrapenable

Syntax Description

None.

Command Defaults

None.

Command Mode

Read-Write.

Example

This example shows how to reset the span guard trap function to enabled:

```
A2 (rw) ->clear spantree spanguardtrapenable
```

5.2.2 Reviewing and Setting Spanning Tree Port Parameters

Purpose

To display and set Spanning Tree port parameters.

Commands

The commands used to review and set Spanning Tree port parameters are listed below and described in the associated section as shown.

- show spantree portadmin ([Section 5.2.2.1](#))
- set spantree portadmin ([Section 5.2.2.2](#))
- clear spantree portadmin ([Section 5.2.2.3](#))
- show spantree portpri ([Section 5.2.2.4](#))
- set spantree portpri ([Section 5.2.2.5](#))
- clear spantree portpri ([Section 5.2.2.6](#))
- show spantree adminpathcost ([Section 5.2.2.7](#))
- set spantree adminpathcost ([Section 5.2.2.8](#))
- clear spantree adminpathcost ([Section 5.2.2.9](#))
- show spantree adminedge ([Section 5.2.2.10](#))
- set spantree adminedge ([Section 5.2.2.11](#))
- clear spantree adminedge ([Section 5.2.2.12](#))

5.2.2.1 show spantree portadmin

Use this command to display the status of the Spanning Tree algorithm on one or more ports.

show spantree portadmin [**port** *port-string*]

Syntax Description

port <i>port-string</i>	(Optional) Displays status for specific port(s). For a detailed description of possible <i>port-string</i> values, refer to Section 3.1.1 .
--------------------------------	---

Command Defaults

If *port-string* is not specified, status will be displayed for all ports.

Command Mode

Read-Only.

Example

This example shows how to display port admin status for fe.1.7:

```
A2 (rw) -> show spantree portadmin port fe.1.7
Port fe.1.7 has portadmin set to enabled
```

5.2.2.2 set spantree portadmin

Use this command to disable or enable the Spanning Tree algorithm on one or more ports.

```
set spantree portadmin port-string {disable | enable}
```

Syntax Description

<i>port-string</i>	Specifies the port(s) for which to enable or disable Spanning Tree. For a detailed description of possible <i>port-string</i> values, refer to Section 3.1.1 .
disable enable	Disables or enables Spanning Tree.

Command Defaults

None.

Command Mode

Read-Write.

Example

This example shows how to disable Spanning Tree on fe.1.5:

```
A2 (rw) ->set spantree portadmin fe.1.5 disable
```

5.2.2.3 clear spantree portadmin

Use this command to reset the default Spanning Tree admin status to enable on one or more ports.

clear spantree portadmin *port-string*

Syntax Description

<i>port-string</i>	Resets the default admin status on specific port(s). For a detailed description of possible <i>port-string</i> values, refer to Section 3.1.1 .
--------------------	---

Command Defaults

None.

Command Mode

Read-Write.

Example

This example shows how to reset the default Spanning Tree admin state to enable on fe.1.12:

```
A2 (rw) ->clear spantree portadmin fe.1.12
```

5.2.2.4 show spantree portpri

Use this command to show the Spanning Tree priority for one or more ports. Port priority is a component of the port ID, which is one element used in determining Spanning Tree port roles.

```
show spantree portpri [port port-string] [sid sid]
```

Syntax Description

port port-string	(Optional) Specifies the port(s) for which to display Spanning Tree priority. For a detailed description of possible port-string values, refer to Section 3.1.1 .
sid sid	(Optional) Displays port priority for a specific Spanning Tree identifier. Valid values are 0 - 4094. If not specified, SID 0 is assumed.

Command Defaults

- If port-string is not specified, port priority will be displayed for all Spanning Tree ports.
- If sid is not specified, port priority will be displayed for Spanning Tree 0.

Command Mode

Read-Only.

Example

This example shows how to display the port priority for fe.2.7:

```
A2 (rw) -> show spantree portpri port fe.2.7
Port fe.2.7 has a Port Priority of 128 on SID 0
```

5.2.2.5 set spantree portpri

Use this command to set a port's Spanning Tree priority.

set spantree portpri *port-string* *priority* [**sid** *sid*]

Syntax Description

<i>port-string</i>	Specifies the port(s) for which to set Spanning Tree port priority. For a detailed description of possible <i>port-string</i> values, refer to Section 3.1.1 .
<i>priority</i>	Specifies a number that represents the priority of a link in a Spanning Tree bridge. Valid values are from 0 to 240 (in increments of 16) with 0 indicating high priority.
sid <i>sid</i>	(Optional) Sets port priority for a specific Spanning Tree identifier. Valid values are 0 - 4094 . If not specified, SID 0 is assumed.

Command Defaults

If *sid* is not specified, port priority will be set for Spanning Tree 0.

Command Mode

Read-Write.

Example

This example shows how to set the priority of fe.1.3 to 240 on SID 1:

```
A2 (rw) -> set spantree portpri fe.1.3 240 sid 1
```

5.2.2.6 clear spantree portpri

Use this command to reset the bridge priority of a Spanning Tree port to a default value of 128.

clear spantree portpri *port-string* [**sid** *sid*]

Syntax Description

<i>port-string</i>	Specifies the port(s) for which to set Spanning Tree port priority. For a detailed description of possible <i>port-string</i> values, refer to Section 3.1.1 .
sid <i>sid</i>	(Optional) Resets the port priority for a specific Spanning Tree identifier. Valid values are 0 - 4094 . If not specified, SID 0 will be assumed.

Command Defaults

If *sid* is not specified, port priority will be set for Spanning Tree 0.

Command Mode

Read-Write.

Example

This example shows how to reset the priority of fe.1.3 to 128 on SID 1:

```
A2 (rw) ->clear spantree portpri fe.1.3 sid 1
```

5.2.2.7 show spantree adminpathcost

Use this command to display the admin path cost for a port on one or more Spanning Trees.

show spantree adminpathcost [**port** *port-string*] [**sid** *sid*]

Syntax Description

port <i>port-string</i>	(Optional) Displays the admin path cost value for specific port(s). For a detailed description of possible <i>port-string</i> values, refer to Section 3.1.1 .
sid <i>sid</i>	(Optional) Displays the admin path cost for a specific Spanning Tree identifier. Valid values are 0 - 4094 . If not specified, SID 0 will be assumed.

Command Defaults

- If *port-string* is not specified, admin path cost for all Spanning Tree ports will be displayed.
- If *sid* is not specified, admin path cost for Spanning Tree 0 will be displayed.

Command Mode

Read-Only.

Example

This example shows how to display the admin path cost for fe.3.4 on SID 1:

```
A2 (rw) -> show spantree adminpathcost port fe.3.4 sid 1
Port fe.3.4 has a Port Admin Path Cost of 0 on SID 1
```

5.2.2.8 set spantree adminpathcost

Use this command to set the administrative path cost on a port and one or more Spanning Trees.

```
set spantree adminpathcost port-string cost [sid sid]
```

Syntax Description

<i>port-string</i>	Specifies the port(s) on which to set an admin path cost. For a detailed description of possible <i>port-string</i> values, refer to Section 3.1.1 .
<i>cost</i>	Specifies the port path cost. Valid values are 0 - 200000000 .
sid <i>sid</i>	(Optional) Sets the admin path cost for a specific Spanning Tree identifier. Valid values are 0 - 4094 . If not specified, SID 0 will be assumed.

Command Defaults

If *sid* is not specified, admin path cost will be set for Spanning Tree 0.

Command Mode

Read-Write.

Example

This example shows how to set the admin path cost to 200 for fe.3.2 on SID 1:

```
A2 (rw) ->set spantree adminpathcost fe.3.2 200 sid 1
```

5.2.2.9 clear spantree adminpathcost

Use this command to reset the Spanning Tree default value for port admin path cost to 0.

clear spantree adminpathcost *port-string* [**sid** *sid*]

Syntax Description

<i>port-string</i>	Specifies the port(s) for which to reset admin path cost. For a detailed description of possible <i>port-string</i> values, refer to Section 3.1.1 .
sid <i>sid</i>	(Optional) Resets the admin path cost for specific Spanning Tree(s). Valid values are 0 - 4094 . If not specified, SID 0 is assumed.

Command Defaults

If *sid* is not specified, admin path cost will be reset for Spanning Tree 0.

Command Mode

Read-Write.

Example

This example shows how to reset the admin path cost to 0 for fe.3.2 on SID 1:

```
A2 (rw) ->clear spantree adminpathcost fe.3.2 sid 1
```

5.2.2.10 show spantree adminedge

Use this command to display the edge port administrative status for a port.

show spantree adminedge [**port** *port-string*]

Syntax Description

port <i>port-string</i>	(Optional) Displays edge port administrative status for specific port(s). For a detailed description of possible <i>port-string</i> values, refer to Section 3.1.1 .
--------------------------------	--

Command Defaults

If *port-string* is not specified edge port administrative status will be displayed for all Spanning Tree ports.

Command Mode

Read-Only.

Example

This example shows how to display the edge port status for fe.3.2:

```
A2 (rw) ->show spantree adminedge port fe.3.2
Port fe.3.2 has a Port Admin Edge of Edge-Port
```

5.2.2.11 set spantree adminedge

Use this command to set the edge port administrative status on a Spanning Tree port. Edge port administrative status begins with the value set to **false** initially after the device is powered up. If a Spanning Tree BPDU is not received on the port within a few seconds, the status setting changes to **true**.

set spantree adminedge *port-string* {**true** | **false**}

Syntax Description

<i>port-string</i>	Specifies the edge port. For a detailed description of possible <i>port-string</i> values, refer to Section 3.1.1 .
true false	Enables (true) or disables (false) the specified port as a Spanning Tree edge port.

Command Defaults

None.

Command Mode

Read-Write.

Example

This example shows how to set fe.1.11 as an edge port:

```
A2 (rw) -> set spantree adminedge fe.1.11 true
```

5.2.2.12 clear spantree adminedge

Use this command to reset a Spanning Tree port to non-edge status.

clear spantree adminedge *port-string*

Syntax Description

<i>port-string</i>	Specifies port(s) on which to reset edge port status. For a detailed description of possible <i>port-string</i> values, refer to Section 3.1.1 .
--------------------	--

Command Defaults

None.

Command Mode

Read-Write.

Example

This example shows how to reset fe.1.11 as a non-edge port:

A2 (rw) ->**clear spantree adminedge fe.1.11**

802.1Q VLAN Configuration

This chapter describes the SecureStack system's capabilities to implement 802.1Q virtual LANs (VLANs). It documents how to:

- Create, enable, disable and name a VLAN.
- Review status and other information related to VLANs.
- Assign ports to a VLAN and filter unwanted frames on one or more ports
- Set VLAN constraints in order to control the filtering database to which VLANs are allowed to belong. Use GVRP (GARP VLAN Registration Protocol) to control and propagate VLAN knowledge through the network.
- Create a secure VLAN for device management security.

NOTE: The device can support up to 1024 802.1Q VLANs. The allowable range for VLANs is 1 to 4093. As a default, all ports on the device are assigned to VLAN ID 1, untagged.

6.1 VLAN CONFIGURATION SUMMARY

Virtual LANs allow the network administrator to partition network traffic into logical groups and control the flow of that traffic through the network. Once the traffic and, in effect, the users creating the traffic, are assigned to a VLAN, then broadcast and multicast traffic is contained within the VLAN and users can be allowed or denied access to any of the network's resources. Also, some or all of the ports on the device can be configured as GVRP ports, which enable frames received with a particular VLAN ID and protocol to be transmitted on a limited number of ports. This keeps the traffic associated with a particular VLAN and protocol isolated from the other parts of the network.

6.1.1 Port Assignment Scheme

For information on this device's port assignment scheme, refer to [Section 3.1.1](#).

6.1.2 Port String Syntax Used in the CLI

For information on how to designate port numbers in the CLI syntax, refer to [Section 3.1.1](#).

6.2 PROCESS OVERVIEW: 802.1Q VLAN CONFIGURATION

Use the following steps as a guide to configure VLANs on the device (refer to the associated section in parentheses):

1. Review existing VLANs ([Section 6.3.1](#))
2. Create and name VLANs ([Section 6.3.2](#))
3. Assign port VLAN IDs and ingress filtering ([Section 6.3.3](#))
4. Configure VLAN Egress ([Section 6.3.4](#))
5. Setting the Host VLAN ([Section 6.3.5](#))
6. Create a secure management VLAN ([Section 6.3.6](#))
7. Enable / Disable GVRP (GARP VLAN Registration Protocol) ([Section 6.3.7](#))

Preparing for VLAN Configuration

A little forethought and planning is essential to a good VLAN implementation. Before attempting to configure a single device for VLAN operation, consider the following:

- How many VLANs will be required?
- What stations will belong to them?
- What ports are connected to those stations?
- What ports will be configured as GVRP-aware ports?

It is also helpful to sketch out a diagram of your VLAN strategy.

6.3 VLAN CONFIGURATION COMMAND SET

6.3.1 Reviewing Existing VLANs

Purpose

To display a list of VLANs currently configured on the device, to determine how one or more VLANs were created, the ports allowed and disallowed to transmit traffic belonging to VLAN(s), and if those ports will transmit the traffic with a VLAN tag included.

Command

The command needed to review existing VLANs is listed below and described in the associated section as shown.

- show vlan ([Section 6.3.1.1](#))

6.3.1.1 show vlan

Use this command to display all information related to one or more VLANs.

```
show vlan [static] [vlan-list] [portinfo [vlan vlan-list | vlan-name] [port
port-string]]
```

Syntax Description

static	(Optional) Displays information related to static VLANs. Static VLANs are manually created using the set vlan command (Section 6.3.2.1), SNMP MIBs, or the WebView management application. The default VLAN, VLAN 1, is always statically configured and can't be deleted. Only ports that use a specified VLAN as their default VLAN (PVID) will be displayed.
<i>vlan-list</i>	(Optional) Displays information for a specific VLAN or range of VLANs.
portinfo	(Optional) Displays VLAN attributes related to one or more ports.
vlan <i>vlan-list</i> <i>vlan-name</i>	(Optional) Displays port information for one or more VLANs.
port <i>port-string</i>	(Optional) Displays port information for one or more ports.

Command Defaults

If no options are specified, all information related to static and dynamic VLANs will be displayed.

Command Mode

Read-Only.

Example

This example shows how to display information for VLAN 1. In this case, VLAN 1 is named “DEFAULT VLAN” and it is enabled to operate. Ports allowed to transmit frames belonging to VLAN 1 are listed as egress ports. Ports that won’t include a VLAN tag in their transmitted frames are listed as untagged ports. There are no forbidden ports (prevented from transmitted frames) on VLAN 1:

```
A2 (rw) -> show vlan 1
VLAN: 1          NAME: DEFAULT VLAN          Status: Enabled
VLAN Type: Permanent
Egress Ports
host.0.1, fe.1.1-10, fe.2.1-4, fe.3.1-7,
Forbidden Egress Ports
None.
Untagged Ports
host.0.1, fe.1.1-10, fe.2.1-4, fe.3.1-7,
```

[Table 6-1](#) provides an explanation of the command output.

Table 6-1 show vlan Output Details

Output	What It Displays...
VLAN	VLAN ID.
NAME	Name assigned to the VLAN.
Status	Whether it is enabled or disabled .
VLAN Type	Whether it is permanent (static) or dynamic .
Egress Ports	Ports configured to transmit frames for this VLAN.
Forbidden Egress Ports	Ports prevented from transmitted frames for this VLAN.
Untagged Ports	Ports configured to transmit untagged frames for this VLAN.

6.3.2 Creating and Naming Static VLANs

Purpose

To create a new static VLAN, or to enable or disable existing VLAN(s).

Commands

The commands used to create and name static VLANs are listed below and described in the associated section as shown.

- set vlan ([Section 6.3.2.1](#))
- set vlan name ([Section 6.3.2.2](#))
- clear vlan ([Section 6.3.2.3](#))
- clear vlan name ([Section 6.3.2.4](#))

6.3.2.1 set vlan

Use this command to create a new static IEEE 802.1Q VLAN, or to enable or disable an existing VLAN. Once a VLAN is created, you can assign it a name using the **set vlan name** command described in [Section 6.3.2.2](#).

NOTE: Each VLAN ID must be unique. If a duplicate VLAN ID is entered, the device assumes that the Administrator intends to modify the existing VLAN.

Enter the VLAN ID using a unique number between 2 and 4093. The VLAN IDs of 0, 1, and 4094 and higher may not be used for user-defined VLANs.

set vlan {create | enable | disable} *vlan-list*

Syntax Description

create enable disable	Creates, enables or disables VLAN(s).
<i>vlan-list</i>	Specifies one or more VLAN IDs to be created, enabled or disabled.

Command Defaults

None.

Command Mode

Read-Write.

Examples

This example shows how to create VLAN 3:

```
A2 (rw) -> set vlan create 3
```

This example shows how to disable VLAN 3:

```
A2 (rw) -> set vlan disable 3
```

6.3.2.2 set vlan name

Use this command to set or change the ASCII name for a new or existing VLAN.

set vlan name *vlan-list* *vlan-name*

Syntax Description

<i>vlan-list</i>	Specifies the VLAN ID of the VLAN(s) to be named.
<i>vlan-name</i>	Specifies the string used as the name of the VLAN (1 to 32 characters).

Command Defaults

None.

Command Mode

Read-Write.

Example

This example shows how to set the name for VLAN 7 to green:

A2 (rw) ->**set vlan name 7 green**

6.3.2.3 clear vlan

Use this command to remove a static VLAN from the list of VLANs recognized by the device.

clear vlan *vlan-list*

Syntax Description

<i>vlan-list</i>	Specifies the VLAN ID of the VLAN(s) to be removed.
------------------	---

Command Defaults

None.

Command Mode

Read-Write.

Example

This example shows how to remove a static VLAN 9 from the device's VLAN list:

```
A2 (rw) ->clear vlan 9
```

6.3.2.4 clear vlan name

Use this command to remove the name of a VLAN from the VLAN list.

clear vlan name *vlan-list*

Syntax Description

<i>vlan-list</i>	Specifies the VLAN ID of the VLAN(s) for which the name will be cleared.
------------------	--

Command Defaults

None.

Command Mode

Read-Write.

Example

This example shows how to clear the name for VLAN 9:

A2 (rw) ->**clear vlan name 9**

6.3.3 Assigning Port VLAN IDs (PVIDs) and Ingress Filtering

Purpose

To assign default VLAN IDs to untagged frames on one or more ports, to configure VLAN ingress filtering and constraints, and to set the frame discard mode.

Commands

The commands used to configure port VLAN IDs and ingress filtering are listed below and described in the associated section as shown.

- show port vlan ([Section 6.3.3.1](#))
- set port vlan ([Section 6.3.3.2](#))
- clear port vlan ([Section 6.3.3.3](#))
- show port ingress filter ([Section 6.3.3.4](#))
- set port ingress filter ([Section 6.3.3.5](#))
- show port discard ([Section 6.3.3.6](#))
- set port discard ([Section 6.3.3.7](#))
- clear port discard ([Section 6.3.3.8](#))

6.3.3.1 show port vlan

Use this command to display port VLAN identifier (PVID) information. PVID determines the VLAN to which all untagged frames received on one or more ports will be classified.

show port vlan [*port-string*]

Syntax Description

<i>port-string</i>	(Optional) Displays PVID information for specific port(s). For a detailed description of possible <i>port-string</i> values, refer to Section 3.1.1 .
--------------------	---

Command Defaults

If *port -string* is not specified, port VLAN information for all ports will be displayed.

Command Mode

Read-Only.

Example

This example shows how to display PVIDs assigned to Fast Ethernet ports 1 through 6 in unit 2. In this case, untagged frames received on these ports will be classified to VLAN 1:

```
A2 (rw) ->show port vlan fe.2.1-6
fe.2.1 is set to 1
fe.2.2 is set to 1
fe.2.3 is set to 1
fe.2.4 is set to 1
fe.2.5 is set to 1
fe.2.6 is set to 1
```

6.3.3.2 set port vlan

Use this command to configure the PVID (port VLAN identifier) for one or more ports. The PVID is used to classify untagged frames as they ingress into a given port. If the specified VLAN has not already been created, this command will create it, add the VLAN to the port's egress list as untagged, and remove the default VLAN from the port's egress list.

set port vlan *port-string* *pvid* [**modify-egress** | **no-modify-egress**]

Syntax Description

<i>port-string</i>	Specifies the port(s) for which to configure a VLAN identifier. For a detailed description of possible <i>port-string</i> values, refer to Section 3.1.1 .
<i>pvid</i>	Specifies the VLAN ID of the VLAN to which port(s) will be added.
modify-egress	(Optional) Adds port(s) to VLAN's untagged egress list and removes them from other untagged egress lists.
no-modify-egress	(Optional) Does not prompt for or make egress list changes.

Command Defaults

None.

Command Mode

Read-Write.

Example

This example shows how to add Fast Ethernet port 10 in unit 1 to the port VLAN list of VLAN 4 (PVID 4). Since VLAN 4 is a new VLAN, it is created. Then port fe.1.10 is added to VLAN 4's untagged egress list, and is cleared from the egress list of VLAN 1 (the default VLAN):

```
A2(rw)->set port vlan fe.1.10 4
A2(rw)->set vlan 4 create
A2(rw)->set vlan egress 4 fe.1.10 untagged
A2(rw)->clear vlan egress 1 fe.1.10
```

6.3.3.3 clear port vlan

Use this command to reset a port’s 802.1Q port VLAN ID (PVID) to the host VLAN ID 1.

clear port vlan *port-string*

Syntax Description

<i>port-string</i>	Specifies the port(s) to be reset to the host VLAN ID 1. For a detailed description of possible <i>port-string</i> values, refer to Section 3.1.1 .
--------------------	---

Command Defaults

None.

Command Mode

Read-Write.

Example

This example shows how to reset the Fast Ethernet ports 3 and 11 in unit1 to a VLAN ID of 1 (Host VLAN):

A2 (rw) ->**clear port vlan fe.1.3,fe.1.11**

6.3.3.4 show port ingress filter

Use this command to show all ports that are enabled for port ingress filtering, which limits incoming VLAN ID frames according to a port VLAN egress list. If the VLAN ID specified in the received frame is not on the port's VLAN egress list, then that frame is dropped and not forwarded.

show port ingress-filter [*port-string*]

Syntax Description

<i>port-string</i>	(Optional) Specifies the port(s) for which to display ingress filtering status. For a detailed description of possible <i>port-string</i> values, refer to Section 3.1.1 .
--------------------	--

Command Defaults

If *port-string* is not specified, ingress filtering status for all ports will be displayed.

Command Mode

Read-Only.

Example

This example shows how to display the port ingress filter status for Fast Ethernet ports 10 through 15 in unit 1. In this case, the ports are disabled for ingress filtering:

```
A2 (rw) -> show port ingress-filter fe.1.10-15
  Port      State
  -----
  fe.1.10   disabled
  fe.1.11   disabled
  fe.1.12   disabled
  fe.1.13   disabled
  fe.1.14   disabled
  fe.1.15   disabled
```

6.3.3.5 set port ingress filter

Use this command to discard all frames received with a VLAN ID that don’t match the port’s VLAN egress list. When ingress filtering is enabled on a port, the VLAN IDs of incoming frames are compared to the port’s egress list. If the received VLAN ID does not match a VLAN ID on the port’s egress list, then the frame is dropped.

Ingress filtering is implemented according to the IEEE 802.1Q standard.

set port ingress-filter *port-string* {disable | enable}

Syntax Description

<i>port-string</i>	Specifies the port(s) on which to enable or disable ingress filtering. For a detailed description of possible <i>port-string</i> values, refer to Section 3.1.1 .
disable enable	Disables or enables ingress filtering.

Command Defaults

None.

Command Mode

Read-Write.

Example

This example shows how to enable port ingress filtering on fe.1.3:

```
A2 (rw) -> set port ingress-filter fe.1.3 enable
```

6.3.3.6 show port discard

Use this command to display the frame discard mode for one or more ports. Ports can be set to discard frames based on whether or not the frame contains a VLAN tag. They can also be set to discard both tagged and untagged frames, or neither.

show port discard [*port-string*]

Syntax Description

<i>port-string</i>	(Optional) Displays the frame discard mode for specific port(s). For a detailed description of possible <i>port-string</i> values, refer to Section 3.1.1 .
--------------------	---

Command Defaults

If *port-string* is not specified, frame discard mode will be displayed for all ports.

Command Mode

Read-Only.

Example

This example shows how to display the frame discard mode for Fast Ethernet port 7 in unit 2. In this case, the port has been set to discard all tagged frames:

```
A2 (rw) -> show port discard fe.2.7
Port          Discard Mode
-----
fe.2.7        tagged
```

6.3.3.7 set port discard

Use this command to set the frame discard mode on one or more ports. The options are to discard all incoming tagged frames, all incoming untagged frames, neither (essentially allow all traffic), or both (essentially discarding all traffic).

A common practice is to discard all tagged packets on user ports. Typically an Administrator does not want the end users defining what VLAN they use for communication.

set port discard *port-string* {tagged | untagged | both | none}

Syntax Description

<i>port-string</i>	Specifies the port(s) for which to set frame discard mode. For a detailed description of possible <i>port-string</i> values, refer to Section 3.1.1 .
tagged untagged both none	<ul style="list-style-type: none">Tagged - Discard all incoming (received) tagged packets on the defined port(s).Untagged - Discard all incoming untagged packets.Both - All traffic will be discarded (tagged and untagged).None - No packets will be discarded.

Command Defaults

None.

Command Mode

Read-Write.

Example

This example shows how to discard all tagged frames received on port fe.3.3:

```
A2 (rw) ->set port discard fe.3.3 tagged
```

6.3.3.8 clear port discard

Use this command to reset the frame discard mode to the factory default setting (none).

clear port discard *port-string*

Syntax Description

<i>port-string</i>	Specifies the port(s) for which to reset frame discard mode. For a detailed description of possible <i>port-string</i> values, refer to Section 3.1.1 .
--------------------	---

Command Defaults

None.

Command Mode

Read-Write.

Example

This example shows how to reset fe.2.7 to the default discard mode of “none”:

```
A2 (rw) ->clear port discard fe.2.7
```

6.3.4 Configuring the VLAN Egress List

Purpose

To assign or remove ports on the egress list of a particular VLAN. This determines which ports on the switch will be eligible to transmit frames for a particular VLAN. For example, ports 1, 5, 7, 8 could be allowed to transmit frames belonging to VLAN 20 and ports 7,8, 9, 10 could be allowed to transmit frames tagged with VLAN 30 (a port can belong to multiple VLAN Egress lists). Note that the Port Egress list for ports 7 and 8 would contain both VLAN 20 and 30.

The port egress type for all ports can be set to tagged, forbidden, or untagged. In general, VLANs have no egress (except for VLAN 1) until they are configured by static administration, or through dynamic mechanisms (such as GVRP).

Setting a port to forbidden prevents it from participating in the specified VLAN and ensures that any dynamic requests (either through GVRP or dynamic egress) for the port to join the VLAN will be ignored. Setting a port to untagged allows it to transmit frames without a tag header. This setting is usually used to configure a port connected to an end user device. Frames sent between VLAN aware switches are typically tagged.

The default VLAN defaults its egress to untagged for all ports.

Commands

The commands used to configure VLAN egress and dynamic VLAN egress are listed below and described in the associated section as shown.

- show port egress ([Section 6.3.4.1](#))
- set vlan forbidden ([Section 6.3.4.2](#))
- set vlan egress ([Section 6.3.4.3](#))
- clear vlan egress ([Section 6.3.4.4](#))
- show vlan dynamic egress ([Section 6.3.4.5](#))
- set vlan dynamic egress ([Section 6.3.4.6](#))

6.3.4.1 show port egress

Use this command to display the VLAN membership for one or more ports.

show port egress [*port-string*]

Syntax Description

<i>port-string</i>	(Optional) Displays VLAN membership for specific port(s). For a detailed description of possible <i>port-string</i> values, refer to Section 3.1.1 .
--------------------	---

Command Defaults

If *port-string* is not specified, VLAN membership will be displayed for all ports.

Command Mode

Read-Write.

Example

This example shows you how to show VLAN egress information for fe.1.1 through 3. In this case, all three ports are allowed to transmit VLAN 1 frames as tagged and VLAN 10 frames as untagged. Both are static VLANs:

A2 (rw) -> show port egress fe.1.1-3			
Port Number	Vlan Id	Egress Status	Registration Status

fe.1.1	1	tagged	static
fe.1.1	10	untagged	static
fe.1.2	1	tagged	static
fe.1.2	10	untagged	static
fe.1.3	1	tagged	static
fe.1.3	10	untagged	static

6.3.4.2 set vlan forbidden

Use this command to prevent one or more ports from participating in a VLAN. This setting instructs the device to ignore dynamic requests (either through GVRP or dynamic egress) for the port to join the VLAN.

set vlan forbidden *vlan-id port-string*

Syntax Description

<i>vlan-id</i>	Specifies the VLAN for which to set forbidden port(s).
<i>port-string</i>	Specifies the port(s) to set as forbidden for the specified <i>vlan-id</i> .

Command Defaults

None.

Command Mode

Read-Write.

Example

This example shows you how to set fe.1.3 to forbidden for VLAN 6:

A2 (rw) ->**set vlan forbidden 6 fe.1.3**

6.3.4.3 set vlan egress

Use this command to add ports to the VLAN egress list for the device, or to prevent one or more ports from participating in a VLAN. This determines which ports will transmit frames for a particular VLAN.

set vlan egress *vlan-list* *port-string* [**untagged** | **forbidden** | **tagged**]

Syntax Description

<i>vlan-list</i>	Specifies the VLAN where a port(s) will be added to the egress list.
<i>port-string</i>	Specifies one or more ports to add to the VLAN egress list of the specified <i>vlan-list</i> . For a detailed description of possible <i>port-string</i> values, refer to Section 3.1.1 .
untagged forbidden tagged	(Optional) Adds the specified ports as: <ul style="list-style-type: none"> • untagged — Causes the port(s) to transmit frames without an IEEE 802.1Q header tag. • forbidden — Instructs the device to ignore dynamic requests (either through GVRP or dynamic egress) from the port(s) to join the VLAN and disallows egress on that port. • tagged — Causes the port(s) to transmit 802.1Q tagged frames.

Command Defaults

If **untagged**, **forbidden** or **tagged** is not specified, the port will be added to the VLAN egress list as tagged.

Command Mode

Read-Write.

Examples

This example shows how to add fe.1.5 through 10 to the egress list of VLAN 7. This means that these ports will transmit VLAN 7 frames as tagged:

```
A2 (rw) ->set vlan egress 7 fe.1.5-10
```

This example shows how to forbid Fast Ethernet ports 13 through 15 in unit 1 from joining VLAN 7 and disallow egress on those ports:

```
A2 (rw) -> set vlan egress 7 fe.1.13-15 forbidden
```

This example shows how to allow Fast Ethernet port 2 in unit 1 to transmit VLAN 7 frames as untagged:

```
A2 (rw) -> set vlan egress 7 fe.1.2 untagged
```

6.3.4.4 clear vlan egress

Use this command to remove ports from a VLAN's egress list.

clear vlan egress *vlan-list* *port-string* [**forbidden**]

Syntax Description

<i>vlan-list</i>	Specifies the number of the VLAN from which a port(s) will be removed from the egress list.
<i>port-string</i>	Specifies one or more ports to be removed from the VLAN egress list of the specified <i>vlan-list</i> . For a detailed description of possible <i>port-string</i> values, refer to Section 3.1.1 .
forbidden	(Optional) Clears the forbidden setting from the specified port(s) and resets the port(s) as able to egress frames if so configured by either static or dynamic means.

Command Defaults

If **forbidden** is not specified, tagged and untagged settings will be cleared.

Command Mode

Read-Write.

Examples

This example shows how to remove fe.3.14 from the egress list of VLAN 9:

```
A2 (rw) ->clear vlan egress 9 fe.3.14
```

This example shows how to remove all Fast Ethernet ports on unit 2 from the egress list of VLAN 4:

```
A2 (rw) ->clear vlan egress 4 fe.2.*
```

6.3.4.5 show vlan dynamicegress

Use this command to display the status of dynamic egress (enabled or disabled) for one or more VLANs.

show vlan dynamicegress [*vlan-list*]

Syntax Description

<i>vlan-list</i>	(Optional) Displays dynamic egress status for specific VLAN(s).
------------------	---

Command Defaults

If *vlan-list* is not specified, the dynamic egress status for all VLANs will be displayed.

Command Mode

Read-Write.

Example

This example shows how to display the dynamic egress status for VLANs 50-55:

```
A2 (rw) -> show vlan dynamicegress 50-55
VLAN 50 is disabled
VLAN 51 is disabled
VLAN 52 is disabled
VLAN 53 is enabled
VLAN 54 is enabled
VLAN 55 is enabled
```

6.3.4.6 set vlan dynamicegress

Use this command to administratively set the dynamic egress status for one or more VLANs. If dynamic egress is enabled for a particular VLAN, when a port receives a frame tagged with that VLAN's ID, the switch will add the receiving port to that VLAN's egress list. Dynamic egress is disabled on the SecureStack A2 by default.

For example, assume you have 20 AppleTalk users on your network who are mobile users (that is, use different ports every day), but you want to keep the AppleTalk traffic isolated in its own VLAN. You can create an AppleTalk VLAN with a VLAN ID of 55 with a classification rule that all AppleTalk traffic gets tagged with VLAN ID 55. Then, you enable dynamic egress for VLAN 55. Now, when an AppleTalk user plugs into port ge.3.5 and sends an AppleTalk packet, the switch will tag the packet to VLAN 55 and also add port ge.3.5 to VLAN 55's egress list, which allows the AppleTalk user to receive AppleTalk traffic.

set vlan dynamicegress *vlan-list* {enable | disable}

Syntax Description

<i>vlan-list</i>	Specify the VLANs by ID to enable or disable dynamic egress.
enable disable	Enables or disables dynamic egress.

Command Defaults

None.

Command Mode

Read-Write.

Example

This example shows how to enable dynamic egress on VLAN 55:

```
A2 (rw) -> set vlan dynamicegress 55 enable
```

6.3.5 Setting the Host VLAN

Purpose

To configure a host VLAN that only select devices are allowed to access. This secures the host port for management-only tasks.

NOTE: The host port is the management entity of the device.

Commands

The commands needed to configure host VLANs are listed below and described in the associated section as shown.

- show host vlan ([Section 6.3.5.1](#))
- set host vlan ([Section 6.3.5.2](#))
- clear host vlan ([Section 6.3.5.3](#))

6.3.5.1 show host vlan

Use this command to display the current host VLAN.

show host vlan

Syntax Description

None.

Command Defaults

None.

Command Mode

Read-Only.

Example

This example shows how to display the host VLAN:

```
A2 (rw) -> show host vlan  
Host vlan is 7.
```

6.3.5.2 set host vlan

Use this command to assign host status to a VLAN. The host VLAN should be a secure VLAN where only designated users are allowed access. For example, a host VLAN could be specifically created for device management. This would allow a management station connected to the management VLAN to manage all ports on the device and make management secure by preventing management via ports assigned to other VLANs.

set host vlan *vlan-id*

NOTE: Before you can designate a VLAN as the host VLAN, you must create a VLAN using the set of commands described in [Section 6.3.2](#).

Syntax Description

<i>vlan-id</i>	Specifies the number of the VLAN to set as the host VLAN.
----------------	---

Command Defaults

None.

Command Mode

Read-Write.

Example

This example shows how to set VLAN 7 as the host VLAN:

```
A2 (rw) ->set host vlan 7
```

6.3.5.3 clear host vlan

Use this command to reset the host VLAN to the default setting of 1.

clear host vlan

Syntax Description

None.

Command Defaults

None.

Command Mode

Read-Write.

Example

This example shows how to set the host VLAN to the default setting:

```
A2 (rw) ->clear host vlan
```

6.3.6 Creating a Secure Management VLAN

If the SecureStack A2 device is to be configured for multiple VLAN's, it may be desirable to configure a management-only VLAN. This allows a station connected to the management VLAN to manage the device. It also makes management secure by preventing configuration via ports assigned to other VLANs.

To create a secure management VLAN, you must:

1. Create a new VLAN. ([Section 6.3.2.1](#))
2. Set the PVID for the desired switch port to the VLAN created in Step 1. ([Section 6.3.3.2](#))
3. Add the desired switch port to the egress list for the VLAN created in Step 1. ([Section 6.3.4.3](#))
4. Assign host status to the VLAN. ([Section 6.3.5.2](#))
5. Set a private community name and access policy. ([Section 4.3.2.8](#))

The commands used to create a secure management VLAN are listed in [Table 6-2](#) and described in the associated section as shown.

NOTES: By default at device startup, there is one VLAN configured on the SecureStack A2 device. It is VLAN ID 1, the DEFAULT VLAN. The default community name, which determines remote access for SNMP management, is set to “public” with read-write access.

This example assumes the management station is attached to fe.1.1 and wants untagged frames.

The process described in this section would be repeated on every device that is connected in the network to ensure that each device has a secure management VLAN.

Table 6-2 Command Set for Creating a Secure Management VLAN

To do this...	Use these commands...
Create a new VLAN and confirm settings.	set vlan create 2 (Section 6.3.2.1) (Optional) show vlan 2 (Section 6.3.1.1)
Set the PVID to the new VLAN.	set port vlan fe.1.1 2 (Section 6.3.3.2)
Add the port to the new VLAN's egress list.	set vlan egress 2 fe.1.1 untagged (Section 6.3.4.3)
Assign host status to the VLAN.	set vlan host 2 (Section 6.3.5.2)
Set a private community name and access policy and confirm settings.	set snmp community private (Section 4.3.2.8) (Optional) show snmp community (Section 4.3.2.7)

6.3.7 Enabling/Disabling GVRP (GARP VLAN Registration Protocol)

Purpose

To dynamically create VLANs across a switched network. The GVRP command set is used to display GVRP configuration information, the current global GVRP state setting, individual port settings (enable or disable) and timer settings. By default, GVRP is enabled globally, but disabled on all ports.

More About GARP VLAN Registration Protocol (GVRP)

The following sections describe the device operation when its ports are operating under the Generic Attribute Registration Protocol (GARP) application – GARP VLAN Registration Protocol (GVRP).

Overview

The purpose of GVRP is to dynamically create VLANs across a switched network. When a VLAN is declared, the information is transmitted out GVRP configured ports on the device in a GARP formatted frame using the GVRP multicast MAC address. A switch that receives this frame, examines the frame, and extracts the VLAN IDs. GVRP then creates the VLANs and adds the receiving port to its tagged member list for the extracted VLAN ID (s). The information is then transmitted out the other GVRP configured ports of the device. [Figure 6-1](#) shows an example of how VLAN blue from end station A would be propagated across a switchnetwork.

How It Works

In [Figure 6-1](#), Switch 4, port 1 is registered as being a member of VLAN Blue and then declares this fact out all its ports (2 and 3) to Switch 1 and Switch 2. These two devices register this in the port egress lists of the ports (Switch 1, port 1 and Switch 2, port 1) that received the frames with the information. Switch 2, which is connected to Switch 3 and Switch 5 declares the same information to those two devices and the port egress list of each port is updated with the new information, accordingly.

Figure 6-1 Example of VLAN Propagation via GVRP

Configuring a VLAN on an 802.1Q switch creates a static VLAN entry. The entry will always remain registered and will not time out. However, dynamic entries will time-out and their registrations will be removed from the member list if the end station A is removed. This ensures that, if switches are disconnected or if end stations are removed, the registered information remains accurate.

The end result is that the port egress list of a port is updated with information about VLANs that reside on that port, even if the actual station on the VLAN is several hops away.

Commands

The commands used to configure GVRP are listed below and described in the associated section as shown.

- show gvrp ([Section 6.3.7.1](#))
- show garp timer ([Section 6.3.7.2](#))
- set gvrp ([Section 6.3.7.3](#))
- clear gvrp ([Section 6.3.7.4](#))
- set garp timer ([Section 6.3.7.5](#))

6.3.7.1 show gvrp

Use this command to display GVRP configuration information.

```
show gvrp [port-string]
```

Syntax Description

<i>port-string</i>	(Optional) Displays GVRP configuration information for specific port(s). For a detailed description of possible <i>port-string</i> values, refer to Section 3.1.1 .
--------------------	---

Command Defaults

If *port-string* is not specified, GVRP configuration information will be displayed for all ports and the device.

Command Mode

Read-Only.

Example

This example shows how to display GVRP status for the device and for Fast Ethernet port 1 in unit 2:

```
A2 (rw) -> show gvrp fe.2.1
Global GVRP status is enabled.

Port Number      GVRP status      Last PDU Origin
-----
fe.2.1           enabled          00-e0-63-97-d4-36
```

[Table 6-3](#) provides an explanation of the command output.

Table 6-3 show gvrp Output Details

Output	What It Displays...
Port Number	Port designation. For a detailed description of possible <i>port-string</i> values, refer to Section 3.1.1 .
GVRP status	Whether GVRP is enabled or disabled on the port.
Last PDU Origin	MAC address of the last GVRP frame received on the port.

6.3.7.2 show garp timer

Use this command to display GARP timer values for one or more ports.

show garp timer [*port-string*]

Syntax Description

<i>port-string</i>	(Optional) Displays GARP timer information for specific port(s). For a detailed description of possible <i>port-string</i> values, refer to Section 3.1.1 .
--------------------	---

Command Defaults

If *port-string* is not specified, GARP timer information will be displayed for all ports.

Command Mode

Read-Only.

Example

This example shows how to display GARP timer information on Fast Ethernet ports 1 through 10 in unit 1:

NOTE: For a functional description of the terms **join**, **leave**, and **leaveall** timers, refer to the standard IEEE 802.1Q documentation, which is not supplied with this device.

```
A2 (rw) -> show garp timer fe.1.1-10
Port based GARP Configuration: (Timer units are centiseconds)
Port Number      Join      Leave      Leaveall
-----
fe.1.1           20        60         1000
fe.1.2           20        60         1000
fe.1.3           20        60         1000
fe.1.4           20        60         1000
fe.1.5           20        60         1000
fe.1.6           20        60         1000
fe.1.7           20        60         1000
fe.1.8           20        60         1000
fe.1.9           20        60         1000
fe.1.10          20        60         1000
```

Table 6-4 provides an explanation of the command output. For details on using the **set gvrp** command to enable or disable GVRP, refer to [Section 6.3.7.3](#). For details on using the **set garp timer** command to change default timer values, refer to [Section 6.3.7.5](#).

Table 6-4 show garp timer Output Details

Output	What It Displays...
Port Number	Port designation. For a detailed description of possible <i>port-string</i> values, refer to Section 3.1.1 .
Join	Join timer setting.
Leave	Leave timer setting.
Leaveall	Leavall timer setting.

6.3.7.3 set gvrp

Use this command to enable or disable GVRP globally on the device or on one or more ports.

set gvrp {enable | disable} [*port-string*]

Syntax Description

disable enable	Disables or enables GVRP on the device.
<i>port-string</i>	(Optional) Disables or enables GVRP on specific port(s). For a detailed description of possible <i>port-string</i> values, refer to Section 3.1.1 .

Command Defaults

If *port-string* is not specified, GVRP will be disabled or enabled for all ports.

Command Mode

Read-Write.

Examples

This example shows how to enable GVRP globally on the device:

```
A2 (rw) -> set gvrp enable
```

This example shows how to disable GVRP globally on the device:

```
A2 (rw) -> set gvrp disable
```

This example shows how to enable GVRP on fe.1.3:

```
A2 (rw) -> set gvrp enable fe.1.3
```

6.3.7.4 clear gvrp

Use this command to clear GVRP status or on one or more ports.

clear gvrp [*port-string*]

Syntax Description

<i>port-string</i>	(Optional) Clears GVRP status on specific port(s). For a detailed description of possible <i>port-string</i> values, refer to Section 3.1.1 .
--------------------	---

Command Defaults

If *port-string* is not specified, GVRP status will be cleared for all ports.

Command Mode

Read-Write.

Example

This example shows how to clear GVRP status globally on the device:

A2 (rw) ->**clear gvrp**

6.3.7.5 set garp timer

Use this command to adjust the values of the join, leave, and leaveall timers.

set garp timer {[**join timer-value**] [**leave timer-value**] [**leaveall timer-value**]}
port-string

NOTE: The setting of these timers is critical and should only be changed by personnel familiar with the 802.1Q standards documentation, which is not supplied with this device.

Syntax Description

join timer-value	Sets the GARP join timer in centiseconds (Refer to 802.1Q standard.)
leave timer-value	Sets the GARP leave timer in centiseconds (Refer to 802.1Q standard.)
leaveall timer-value	Sets the GARP leaveall timer in centiseconds (Refer to 802.1Q standard.)
<i>port-string</i>	Specifies the port(s) on which to configure GARP timer settings. For a detailed description of possible <i>port-string</i> values, refer to Section 3.1.1 .

Command Defaults

None.

Command Mode

Read-Write.

Examples

This example shows how to set the GARP join timer value to 100 centiseconds for all ports:

```
A2 (rw) -> set garp timer join 100 *.*.*
```

This example shows how to set the leave timer value to 300 centiseconds for all ports:

```
A2 (rw) -> set garp timer leave 300 *.*.*
```

This example shows how to set the leaveall timer value to 20000 centiseconds for all ports:

```
A2 (rw) -> set garp timer leaveall 20000 *.*.*
```

Differentiated Services Configuration

This chapter describes the Differentiated Services (Diffserv) set of commands and how to use them.

7.1 DIFFERENTIATED SERVICES CONFIGURATION SUMMARY

SecureStack A2 devices support Diffserv policy-based provisioning of network resources by allowing IT administrators to:

- Create, change or remove Diffserv policies based on business-specific use of network services.
- Prioritize and police traffic according to assigned policies and conditions.
- Assign or unassign ports to Diffserv policies so that only ports activated for a policy will be allowed to transmit frames accordingly.

7.2 PROCESS OVERVIEW: DIFFERENTIATED SERVICES CONFIGURATION

Use the following steps as a guide to configure Diffserv on the device:

1. Globally enabling or disabling Diffserv ([Section 7.3.1](#))
2. Creating Diffserv traffic classes and matching conditions ([Section 7.3.2](#))
3. Configuring policies and assigning traffic classes ([Section 7.3.3](#))
4. Assigning policies to service ports ([Section 7.3.4](#))

7.3 DIFFERENTIATED SERVICES CONFIGURATION COMMAND SET

7.3.1 Globally Enabling or Disabling Diffserv

Purpose

To globally enable or disable Diffserv on the device.

Command

The command used to globally enable or disable Diffserv on the device is listed below and described in the associated section as shown.

- set diffserv adminmode ([Section 7.3.1.1](#))

7.3.1.1 set diffserv adminmode

Use this command to globally enable or disable Diffserv on the device. By default, this function is disabled at device startup.

set diffserv adminmode {enable | disable}

Syntax Description

enable disable	Enables or disables Diffserv.
-------------------------	-------------------------------

Command Defaults

None.

Command Type

Switch command.

Command Mode

Read-Write.

Example

This example shows how to enable Diffserv:

```
A2 (rw) -> set diffserv adminmode enable
```

7.3.2 Creating Diffserv Classes and Matching Conditions

Purpose

To review, create, and configure Diffserv classes and matching conditions.

Commands

The commands used to review, create, and configure Diffserv classes and matching conditions are listed below and described in the associated section as shown.

- show diffserv info ([Section 7.3.2.1](#))
- show diffserv class ([Section 7.3.2.2](#))
- set diffserv class create ([Section 7.3.2.3](#))
- set diffserv class delete ([Section 7.3.2.4](#))
- set diffserv class match ([Section 7.3.2.5](#))
- set diffserv class rename ([Section 7.3.2.6](#))

7.3.2.1 show diffserv info

Use this command to display general Diffserv status information.

show diffserv info

Syntax Description

None.

Command Defaults

None.

Command Type

Switch command.

Command Mode

Read-Only.

Example

This example shows how to display general Diffserv status information:

```
A2 (rw) ->show diffserv info

DiffServ Admin Mode..... Enable
Class Table Size Current/Max..... 0 / 25
Class Rule Table Size Current/Max..... 0 / 150
Policy Table Size Current/Max..... 1 / 12
Policy Instance Table Size Current/Max..... 0 / 120
Policy Attribute Table Size Current/Max..... 0 / 120
Service Table Size Current/Max..... 0 / 416
```

7.3.2.2 show diffserv class

Use this command to display information about Diffserv classes.

```
show diffserv class {summary | detailed classname}
```

Syntax Description

summary	Displays a summary of Diffserv class information.
detailed <i>classname</i>	Displays detailed Diffserv information for a specific class.

Command Defaults

None.

Command Type

Switch command.

Command Mode

Read-Only.

Example

This example shows how to display a summary of Diffserv class information. In this case, there are two classes configured, named “guest” and “admin”:

```
A2 (rw) ->show diffserv class summary

Class Name          Class Type          Ref Class Name
-----
guest               All
admin               All
```

7.3.2.3 set class create

Use this command to create a new Diffserv class.

```
set diffserv class create {all classname}
```

Syntax Description

all	Specifies that all match conditions must be met before the associated policy is executed.
classname	Specifies a class name for this new Diffserv class.

Command Defaults

None.

Command Type

Switch command.

Command Mode

Read-Write.

Example

This example shows how to create a Diffserv class called “admin”:

```
A2 (rw) ->set diffserv class create all admin
```

7.3.2.4 set diffserv class delete

Use this command to delete a Diffserv class and remove any match assigned to the class.

NOTE: You cannot use this command to delete a class that has been assigned to a policy. Before deleting a class with an assigned policy and service port(s), you must first:

- Remove the service port(s) assigned to the policy using the **set diffserv service remove** command ([Section 7.3.4.3](#)), then
- Remove the specified class using the **set diffserv policy class remove** command ([Section 7.3.3.4](#)).

set diffserv class delete *classname*

Syntax Description

<i>classname</i>	Specifies the class name to be deleted.
------------------	---

Command Defaults

None.

Command Type

Switch command.

Command Mode

Read-Write.

Example

This example shows how to delete the Diffserv “admin” class:

```
A2 (rw) ->set diffserv class delete admin
```

7.3.2.5 set diffserv class match

Use this command to match a Diffserv class to a service condition based on layer 2, 3 and 4 packet parameters. Any policy that is applied must be composed of rules that come from only one of the following four groups.

- Layer 3:
 - Destination IP address (**dstip**)
 - Destination Layer 4 port (**dstl4port**)
 - IP Diffserv Code Point (**ipdscp**)
 - IP precedence field (**ipprecedence**)
 - IP type of service (TOS) field (**iptos**)
 - IP protocol field (**protocol**)
 - Source IP address (**srcip**)
 - Source Layer 4 port (**srcl4port**)
- Layer 2:
 - Destination MAC address (**dstmac**)
 - Source MAC address (**srcmac**)
 - VLAN ID (**vlan**)
- Layer 2 Layer 3 source:
 - Source MAC address (**srcmac**)
 - Source IP address (**srcip**)
 - VLAN ID (**vlan**)
- Layer 2 Layer 3 destination:
 - Destination MAC address (**dstmac**)
 - Destination IP address (**dstip**)
 - VLAN ID (**vlan**)

NOTE: The match type **every** will work with any group.

You cannot create and add a class to a policy before adding any rules (match conditions) to the class. Once a class is added to a policy, you cannot add any more rules (match conditions) to the class. You cannot create outbound policies.

You can only add rules that fit into the same category (shown in the groupings above) to a class. For example, if you create a class and add the match conditions **dstip** and **dstl4port**, you will only be able to add other rules from the L3 group.

Class matches of layer 4 destination or source must be sequenced before the corresponding protocol match, as illustrated in the third example below.

You can only add classes of the same category to a policy.

```
set diffserv class match {[every classname] [dstmac | srcmac classname
macaddr macmask] [dstip | srcip classname ipaddr ipmask] [dstl4port |
srcl4port {keyword classname keyword | number classname portnumber}]
[ipdscp classname dscpval] [ipprecedence classname precedencenumber] [iptos
classname tosbits tosmask] [protocol {keyword classname protocol-name |
number classname protocol-number}] [refclass {add | remove} {classname
refclassname}] [vlan classname vlanid]}
```

Syntax Description

every <i>classname</i>	Matches all packets to a specific class.
dstmac srcmac <i>classname</i> <i>macaddr macmask</i>	Matches to a specific class based on destination or source MAC address.
dstip srcip <i>classname ipaddr</i> <i>ipmask</i>	Matches to a specific class based on destination or source IP address.
dstl4port srcl4port keyword <i>classname keyword</i> number <i>classname</i> <i>portnumber</i>	Matches to a specific class based on destination or source layer 4 port number or keyword. Valid <i>keyword</i> values are: <ul style="list-style-type: none"> • domain • echo • ftp • ftpdata • http • smtp • snmp • telnet • tftp • www Valid <i>portnumber</i> values are 0 - 65535 .
ipdscp <i>classname</i> <i>dscpval</i>	Matches to a specific class based on the value of the IP Diffserv Code Point. Valid numeric or keyword values can be entered as listed in Table 7-1 on page 7-10 .

ipprecedence <i>classname</i> <i>precedencenumber</i>	Matches to a specific class based on the value of the IP precedence field. Valid <i>precedencenumber</i> values are: 0 - 7 .
iptos <i>classname</i> <i>tosbits tosmask</i>	Matches to a specific class based on the value of the IP type of service (TOS) field. Valid <i>tosbits</i> values are 0 - 255 . Valid <i>tosmask</i> values are 1 - 8 .
protocol keyword <i>classname</i> <i>protocol-name</i> number <i>classname</i> <i>protocol-number</i>	Matches to a specific class based on number or keyword in the IP protocol field. Valid <i>protocol-name</i> keywords are: <ul style="list-style-type: none">• icmp• igmp• ip• tcp• udp Valid <i>protocol-number</i> values are 0 - 255 .
refclass add remove <i>classname</i> <i>refclassname</i>	Adds or removes a set of already defined match conditions to a specific class.
vlan <i>classname</i> <i>vlanid</i>	Matches to a specific class based on VLAN ID. Valid values are 1- 4094 .

Table 7-1 Valid IP DSCP Numeric and Keyword Values

Code Point Map	Numeric Value	Keyword (Usage)
b'000000	0	be (best effort)
b'xxx000	0,8,16,24,32,40,48,56	cs0 - cs7 (Class Selector PHB)
b'101110	46	ef (Expedited Forwarding)

Command Defaults

None.

Command Type

Switch command.

Command Mode

Read-Write.

Examples

This example shows how to match the “admin” class to source IP address 130.10.0.32 and only that IP address type:

```
A2 (rw) -> set diffserv class match srcip admin 130.10.0.32 255.255.255.255
```

This example shows how to match the “admin” class to VLAN 10:

```
A2 (rw) -> set diffserv class match vlan admin 10
```

This example shows how to match the “http” class to TCP packets with a destination port of 80 (HTTP). The layer 4 port match must precede the protocol type.

```
A2 (rw) -> set diffserv class match dstl4port keyword http http  
A2 (rw) -> set diffserv class match protocol keyword http tcp
```

7.3.2.6 set diffserv class rename

Use this command to change the name of a Diffserv class.

set diffserv class rename *classname newclassname*

Syntax Description

<i>classname</i>	Specifies the class name previously set for this new Diffserv class.
<i>newclassname</i>	Specifies a new class name.

Command Defaults

None.

Command Type

Switch command.

Command Mode

Read-Write.

Example

This example shows how to rename the Diffserv “admin” class to “system”:

```
A2 (rw) -> set diffserv class rename admin system
```

7.3.3 Configuring Diffserv Policies and Assigning Classes

Purpose

To review, create, and configure Diffserv policies and assign classes.

Commands

The commands used to review, create, and configure Diffserv policies and assign classes are listed below and described in the associated section as shown.

- show diffserv policy ([Section 7.3.3.1](#))
- set diffserv policy create ([Section 7.3.3.2](#))
- set diffserv policy delete ([Section 7.3.3.3](#))
- set diffserv policy class ([Section 7.3.3.4](#))
- set diffserv policy mark ([Section 7.3.3.5](#))
- set diffserv policy police style simple ([Section 7.3.3.6](#))
- set diffserv policy rename ([Section 7.3.3.7](#))

7.3.3.1 show diffserv policy

Use this command to display information about Diffserv policies.

```
show diffserv policy {summary | detailed polycyname}
```

Syntax Description

summary	Displays Diffserv policy summary information.
detailed <i>polycyname</i>	Displays detailed Diffserv information for a specific policy.

Command Defaults

None.

Command Type

Switch command.

Command Mode

Read-Only.

Example

This example shows how to display a summary of Diffserv policy information. In this case, there is one policy named “admin,” to which members of the “admin” class have been assigned. This policy is applied to incoming traffic on its assigned service ports:

A2 (rw) -> show diffserv policy summary		
Policy Name	Policy Type	Class Members
-----	-----	-----
admin	In	admin

7.3.3.2 set diffserv policy create

Use this command to create a new Diffserv policy.

set diffserv policy create *polycyname* {**in**}

Syntax Description

<i>polycyname</i>	Specifies a policy name.
in	Applies this policy to incoming packets.

Command Defaults

None.

Command Type

Switch command.

Command Mode

Read-Write.

Example

This example shows how to create a Diffserv policy called “admin” and apply it to incoming packets:

A2 (rw) ->**set diffserv policy create admin in**

7.3.3.3 set diffserv policy delete

Use this command to delete a Diffserv policy.

NOTE: In order to delete a policy you must first remove the service port(s) assigned to the policy using the **set diffserv service remove** command as described in [Section 7.3.4.3](#).

set diffserv policy delete *policyname*

Syntax Description

<i>policyname</i>	Specifies a policy name to be deleted.
-------------------	--

Command Defaults

None.

Command Type

Switch command.

Command Mode

Read-Write.

Example

This example shows how to delete the Diffserv “admin” policy:

```
A2 (rw) -> set diffserv policy delete admin
```

7.3.3.4 set diffserv policy class

Use this command to add or remove a Diffserv class to a specified policy. Once added, policies will be active for the specified class.

NOTE: Class must be added to a policy using this command before policy parameters, such as bandwidth, marking, and policing, can be configured.

set diffserv policy class {**add** | **remove**} *polycname* *classname*

Syntax Description

add remove	Adds or removes the specified class.
<i>polycname</i>	Specifies the policy name to be associated with the class.
<i>classname</i>	Specifies a class name to add or remove.

Command Defaults

None.

Command Type

Switch command.

Command Mode

Read-Write.

Example

This example shows how to add the “system” class to the “admin” policy:

```
A2 (rw) -> set diffserv policy class add admin system
```

7.3.3.5 set diffserv policy mark

Use this command to mark all packets for the associated Diffserv traffic stream with a specific IP DSCP or IP precedence value.

```
set diffserv policy mark {ipdscp | ipprecedence policyname classname value}
```

Syntax Description

ipdscp ipprecedence	Specifies that packets will be marked with either an IP DSCP or precedence value.
<i>policyname</i>	Specifies the policy name being configured.
<i>classname</i>	Specifies a Diffserv class to associate to this policy.
<i>value</i>	Specifies an IP DSCP or precedence value. Valid numeric or keyword DCSP values can be entered as listed in Table 7-1 on page 7-10 . Valid precedence values are: 0 - 7 .

Command Defaults

None.

Command Type

Switch command.

Command Mode

Read-Write.

Example

This example shows how to mark packets matching the “admin” policy in the “system” class for DSCP expedited forwarding precedence:

```
A2 (rw) ->set diffserv policy mark ipdscp admin system ef
```

7.3.3.6 set diffserv policy police style simple

Use this command to establish the policing style for a Diffserv policy based only on bandwidth for the specified class.

set diffserv policy police style simple *polycname classname bandwidth burstsize*

Syntax Description

<i>polycname</i>	Specifies the policy name being configured.
<i>classname</i>	Specifies a Diffserv class to associate to this policy.
<i>bandwidth</i>	Specifies a bandwidth value. Valid values are 1 - 4294967295 .
<i>burstsize</i>	Specifies a burst size value. Valid values are 1 - 128 .

Command Defaults

None.

Command Type

Switch command.

Command Mode

Read-Write.

Example

This example shows how to configure a bandwidth-based policing style for the “admin” Diffserv policy:

```
A2 (rw) -> set diffserv policy police style simple admin system 1000 128
```

7.3.3.7 set diffserv policy rename

Use this command to change the name of a Diffserv policy.

set diffserv policy rename *policyname newpolicyname*

Syntax Description

<i>policyname</i>	Specifies the policy name previously set for this new Diffserv class.
<i>newpolicyname</i>	Specifies a new policy name.

Command Defaults

None.

Command Type

Switch command.

Command Mode

Read-Write.

Example

This example shows how to rename the “admin” Diffserv policy to “system”:

A2 (rw) ->**set diffserv policy rename admin system**

7.3.4 Assigning Policies to Service Ports

Purpose

To review and assign Diffserv policies and their associated classes to service ports.

Commands

The commands used to review and assign Diffserv policies to service ports are listed below and described in the associated section as shown.

- show diffserv service info ([Section 7.3.4.1](#))
- show diffserv service stats ([Section 7.3.4.2](#))
- set diffserv service ([Section 7.3.4.3](#))

7.3.4.1 show diffserv service info

Use this command to display information about Diffserv service ports.

```
show diffserv service info {summary | detailed port-string} {in}
```

Syntax Description

summary	Displays Diffserv service port summary information.
detailed <i>port-string</i>	Displays detailed information for a specific port(s).
in	Displays information about incoming traffic.

Command Defaults

None.

Command Type

Switch command.

Command Mode

Read-Only.

Example

This example shows how to display a summary of incoming Diffserv service port traffic:

```
A2 (rw) ->show diffserv service info summary in

DiffServ Admin Mode..... Enable

  Interface   Direction   OperStatus   Policy Name
  -----
fe.1.1       In          Up           admin
```

7.3.4.2 show diffserv service stats

Use this command to display Diffserv policy service statistics.

show diffserv service stats {**summary** | **detailed** *port-string*} {**in**}

Syntax Description

summary	Displays Diffserv a summary of service statistics.
detailed <i>port-string</i>	Displays detailed statistics for a specific port.
in	Displays information about incoming traffic.

Command Defaults

None.

Command Type

Switch command.

Command Mode

Read-Only.

Example

This example shows how to display a detailed incoming traffic statistics about service port fe.1.1:

```
A2(rw)->show diffserv service stats detailed fe.1.1 in
Interface..... fe.1.1

Direction..... In
Operational Status..... Up
Policy Name..... admin

Class Name..... system
In Discarded Packets..... 0
```

7.3.4.3 set diffserv service

Use this command to add or remove a Diffserv policy to incoming traffic on one or more ports.

```
set diffserv service {add | remove} {in} port-string policyname
```

Syntax Description

add remove	Adds or removes the specified policy.
in	Adds or removes the specified policy to incoming traffic.
<i>port-string</i>	Specifies the port(s) to which this policy will be applied.
<i>policyname</i>	Specifies the policy name to be added to or removed from port traffic.

Command Defaults

None.

Command Type

Switch command.

Command Mode

Read-Write.

Example

This example shows how to apply the Diffserv policy named “admin” to incoming traffic on ports ge.1.1-10:

A2 (rw) ->set diffserv service add in ge.1.1-10 admin

Port Priority and Rate Limiting Configuration

This chapter describes the Port Priority and Rate Limiting set of commands and how to use them.

8.1 PORT PRIORITY CONFIGURATION SUMMARY

The SecureStack A2 device supports Class of Service (CoS), which allows you to assign mission-critical data to higher priority through the device by delaying less critical traffic during periods of congestion. The higher priority traffic through the device is serviced first before lower priority traffic. The Class of Service capability of the device is implemented by a priority queueing mechanism. Class of Service is based on the IEEE 802.1D (802.1p) standard specification, and allows you to define eight priorities (0 through 7) and assign them to the transmit queues for each port.

A priority 0 through 7 can be set on each port, with 0 being the lowest priority. A port receiving a frame without priority information in its tag header is assigned a priority according to the default priority setting on the port. For example, if the priority of a port is set to 4, the frames received through that port without a priority indicated in their tag header are classified as a priority 4 and transmitted according to that priority.

The device's rate limiting capabilities allow you to prioritize traffic by limiting the rate of inbound traffic on a per port/priority basis.

8.2 PROCESS OVERVIEW: PORT PRIORITY AND RATE LIMITING

Use the following steps as a guide to the port priority, QoS classification, and rate limiting configuration process:

1. Configuring Port Priority ([Section 8.3.1](#))
2. Configuring Priority Queueing ([Section 8.3.2](#))

3. Configuring Port Quality of Service ([Section 8.3.3](#))
4. Configuring Port Traffic Rate Limiting ([Section 8.3.4](#))

8.3 PORT PRIORITY AND RATE LIMITING CONFIGURATION COMMAND SET

8.3.1 Configuring Port Priority

Purpose

To view or configure port priority characteristics as follows:

- Display or change the port default Class-of Service (CoS) transmit priority (0 through 7) of each port for frames that are received (ingress) without priority information in their tag header.
- Display the current traffic class mapping-to-priority of each port.
- Set each port to transmit frames according to 802.1D (802.1p) priority set in the frame header.

Commands

The commands to configure port priority are listed below and described in the associated section.

- show port priority ([Section 8.3.2.1](#))
- set port priority ([Section 8.3.1.2](#))
- clear port priority ([Section 8.3.1.3](#))

8.3.1.1 show port priority

Use this command to display the 802.1D priority for one or more ports.

show port priority [*port-string*]

Syntax Description

<i>port-string</i>	(Optional) Displays priority information for a specific port. For a detailed description of possible <i>port-string</i> values, refer to Section 3.1.1 .
--------------------	--

Command Defaults

If *port-string* is not specified, priority for all ports will be displayed.

Command Mode

Read-Only.

Example

This example shows how to display the port priority for the fe.2.1 through 5:

```
A2 (rw) ->show port priority fe.2.1-5
fe.2.1 is set to 0
fe.2.2 is set to 0
fe.2.3 is set to 0
fe.2.4 is set to 0
fe.2.5 is set to 0
```

8.3.1.2 set port priority

Use this command to set the 802.1D (802.1p) Class-of-Service transmit queue priority (0 through 7) on each port. A port receiving a frame without priority information in its tag header is assigned a priority according to the priority setting on the port. For example, if the priority of a port is set to 5, the frames received through that port without a priority indicated in their tag header are classified as a priority 5.

A frame with priority information in its tag header is transmitted according to that priority.

set port priority *port-string* *priority*

Syntax Description

<i>port-string</i>	Specifies the port for which to set priority. For a detailed description of possible <i>port-string</i> values, refer to Section 3.1.1 .
<i>priority</i>	Specifies a value of 0 - 7 to set the CoS port priority for the port entered in the <i>port-string</i> . Port priority value of 0 is the lowest priority.

Command Defaults

None.

Command Mode

Read-Write.

Example

This example shows how to set a default priority of 6 on fe.1.3. Frames received by this port without priority information in their frame header are set to the default setting of 6:

A2 (rw) ->**set port priority fe.1.3 6**

8.3.1.3 clear port priority

Use this command to reset the current CoS port priority setting to 0. This will cause all frames received without a priority value in its header to be set to priority 0.

clear port priority *port-string*

Syntax Description

<i>port-string</i>	Specifies the port for which to clear priority. For a detailed description of possible <i>port-string</i> values, refer to Section 3.1.1 .
--------------------	--

Command Defaults

None.

Command Mode

Read-Write.

Example

This example shows how to reset fe.1.11 to the default priority:

```
A2 (rw) ->clear port priority fe.1.11
```

8.3.2 Configuring Priority to Transmit Queue Mapping

Purpose

To perform the following:

- View the current priority to transmit queue mapping of each physical port.
- Configure each port to either transmit frames according to the port priority, set using the **set port priority** command described in [Section 8.3.1.2](#), or according to a priority based on a percentage of port transmission capacity, assigned to transmit queues using the **set port txq** command described in [Section 8.3.3.2](#).
- Clear current port priority queue settings for one or more ports.

NOTE: Priority to transmit queue mapping on an individual port basis can only be configured on Gigabit Ethernet ports (ge.x.x). When you use the **set port priority-queue** command to configure a Fast Ethernet port (fe.x.x), the mapping values are applied globally to *all* Fast Ethernet ports on the stack.

Commands

The commands used in configuring transmit priority queues are listed below and described in the associated section.

- show port priority-queue ([Section 8.3.2.1](#))
- set port priority-queue ([Section 8.3.2.2](#))
- clear port priority-queue ([Section 8.3.2.3](#))

8.3.2.1 show port priority-queue

Use this command to display the port priority levels (0 through 7, with 0 as the lowest level) associated with the current transmit queue (0 through 5, with 0 being the lowest priority) for each priority of the selected port. A frame with a certain port priority is transmitted according to the settings entered using the **set priority queue** command described in [Section 8.3.2.2](#).

show port priority-queue [*port-string*]

Syntax Description

<i>port-string</i>	(Optional) Displays the mapping of priorities to transmit queues for one or more ports.
--------------------	---

Command Defaults

If *port-string* is not specified, priority queue information for all ports will be displayed.

Command Mode

Read-Only.

Example

This example shows how to display priority queue information for fe.2.1. In this case, frames with a priority of 0 are associated with transmit queue 1; frames with 1 or 2 priority, are associated with transmit queue 0; and so forth:

```
A2(su)->show port priority-queue fe.2.1
Port      P0 P1 P2 P3 P4 P5 P6 P7
-----
fe.2.1    1  0  0  2  3  4  5  5
```

8.3.2.2 set port priority-queue

Use this command to map 802.1D (802.1p) priorities to transmit queues. This command enables you to change the transmit queue (0 through 5, with 0 being the lowest priority queue) for each port priority of the selected port. You can apply the new settings to one or more ports.

NOTES: Priority to transmit queue mapping on an individual port basis can only be configured on Gigabit Ethernet ports (ge.x.x). When you use the **set port priority-queue** command to configure a Fast Ethernet port (fe.x.x), the mapping values are applied globally to *all* Fast Ethernet ports on the stack.

Although there are eight queues implemented in the switch hardware, only six are available for use in prioritizing various data and control traffic. The 7th and 8th queues are reserved for stacking and network control-related communications. Refer to [Section 8.3.3](#) for more information about configuring the priority mode and weight for these queues.

set port priority-queue *port-string* *priority* *queue*

Syntax Description

<i>port-string</i>	Specifies the port(s) for which to set priority-to-queue mappings. For a detailed description of possible <i>port-string</i> values, refer to Section 3.1.1 .
<i>priority</i>	Specifies a value of 0 – 7 (0 is the lowest level) that determines what priority frames will be transmitted on the transmit queue entered in this command.
<i>queue</i>	Specifies a value of 0 through 5 (0 is the lowest level) that determines the queue on which to transmit the frames with the port priority entered in this command.

Command Defaults

None.

Command Mode

Read-Write.

Example

This example shows how to set priority 5 frames received on fe.2.12 to transmit on queue 0.

```
A2 (rw) ->set port priority-queue fe.2.12 5 0
```

8.3.2.3 clear port priority-queue

Use this command to reset port priority queue settings back to defaults for one or more ports.

clear port priority-queue *port-string*

Syntax Description

<i>port-string</i>	Specifies the port for which to clear priority-to-queue mappings. For a detailed description of possible <i>port-string</i> values, refer to Section 3.1.1 .
--------------------	--

Command Defaults

None.

Command Mode

Read-Write.

Example

This example shows how to clear the priority queue settings on fe.2.12:

```
A2 (rw) ->clear port priority-queue fe.2.12
```

8.3.3 Configuring Quality of Service (QoS)

Purpose

Eight transmit queues are implemented in the switch hardware for each port, but only six are available for use in prioritizing various data and control traffic. The seventh and eighth queues are reserved for stacking and network control related communications.

The commands in this section allow you to set the priority mode and weight for each of the available six queues (queues 0 through 5) for each physical port on the switch. Priority mode and weight cannot be configured on LAGs, only on the physical ports that make up the LAG.

Command Descriptions

The commands to configure the Quality of Service are listed below and described in the associated section.

- show port txq ([Section 8.3.3.1](#))
- set port txq ([Section 8.3.3.2](#))
- clear port txq ([Section 8.3.3.3](#))

8.3.3.1 show port txq

Use this command to display QoS transmit queue information for one or more ports.

show port txq [*port-string*]

Syntax Description

<i>port-string</i>	(Optional) Specifies port(s) for which to display QoS settings. For a detailed description of possible <i>port-string</i> values, refer to Section 3.1.1 . NOTE: Only physical ports will be displayed. LAG ports have no transmit queue information.
--------------------	---

Command Defaults

If the *port-string* is not specified, the QoS setting of all physical ports will be displayed.

Command Mode

Read-Only.

Example

This example shows how to display the current algorithm and transmit queue weights configured on ports ge.1.10 through 24:

```
A2(su)->show port txq ge.1.10-24
Port      Alg  Q0  Q1  Q2  Q3  Q4  Q5  Q6  Q7
-----
ge.1.10 WRR 2   10  15  20  24  29  SP  SP
ge.1.11 WRR 2   10  15  20  24  29  SP  SP
ge.1.12 WRR 2   10  15  20  24  29  SP  SP
ge.1.13 WRR 2   10  15  20  24  29  SP  SP
ge.1.14 WRR 2   10  15  20  24  29  SP  SP
ge.1.15 WRR 2   10  15  20  24  29  SP  SP
ge.1.16 WRR 2   10  15  20  24  29  SP  SP
ge.1.17 WRR 2   10  15  20  24  29  SP  SP
ge.1.18 WRR 2   10  15  20  24  29  SP  SP
ge.1.19 WRR 2   10  15  20  24  29  SP  SP
ge.1.20 WRR 2   10  15  20  24  29  SP  SP
ge.1.21 WRR 2   10  15  20  24  29  SP  SP
ge.1.22 WRR 2   10  15  20  24  29  SP  SP
ge.1.23 WRR 2   10  15  20  24  29  SP  SP
ge.1.24 WRR 2   10  15  20  24  29  SP  SP
```

8.3.3.2 set port txq

Use this command to set QoS transmit queue arbitration values for ports.

Eight transmit queues are implemented in the switch hardware for each port, but only six are available for use in prioritizing various data and control traffic. The seventh and eighth queues are reserved for stacking and network control related communications and cannot be configured.

Queues can be set for strict priority (SP) or weighted round-robin (WRR). If set for WRR mode, weights may be assigned to those queues with this command. Weights are specified in the range of 0 to 100 percent. Weights specified for queues 0 through 5 on any port must total 100 percent.

Queues 0 through 5 can be changed to strict priority by configuring queues 0 through 4 at 0 percent and queue 5 at 100 percent. Queues can be changed back to WRR by changing the weight of queues 0 through 5, or by issuing the **clear port txq** command.

set port txq *port-string* *value0 value1 value2 value3 value4 value5*

Syntax Description

<i>port-string</i>	Specifies port(s) on which to set queue arbitration values. For a detailed description of possible <i>port-string</i> values, refer to Section 3.1.1 . NOTE: Only physical ports can be configured with this command. LAG ports cannot be configured.
<i>value0 - value5</i>	Specifies percentage to allocate to a specific transmit queue. The values must total 100 percent.

Command Defaults

None.

Command Mode

Read-Write.

Examples

This example shows how to change the arbitration values for the six transmit queues belonging to ge.1.1:

```
A2 (su) -> set port txq ge.1.1 17 17 17 17 16 16
```

This example shows how to change the algorithm to strict priority for the six transmit queues belonging to ge.1.1:

```
A2(su)->set port txq ge.1.1 0 0 0 0 0 100
A2(su)->show port txq ge.1.1
```

Port	Alg	Q0	Q1	Q2	Q3	Q4	Q5	Q6	Q7
----	---	---	---	---	---	---	---	---	---
ge.1.1	STR	SP	SP	SP	SP	SP	SP	SP	SP

8.3.3.3 clear port txq

Use this command to clear port transmit queue values back to their default values.

```
clear port txq port-string
```

Syntax Description

<i>port-string</i>	Clears transmit queue values on specific port(s) back to their default values. For a detailed description of possible <i>port-string</i> values, refer to Section 3.1.1 .
--------------------	---

Command Defaults

By default, transmit queues are defined as follows:

Queue	Mode	Weight
0	WRR	1
1	WRR	2
2	WRR	3
3	WRR	4
4	WRR	5
5	WRR	6
6	Strict (not configurable)	—
7	Strict (not configurable)	—

Command Mode

Read-Write.

Example

This example shows how to clear transmit queue values on ge.1.1:

```
A2(su)->clear port txq ge.1.1
```

```
A2(su)->show port txq ge.1.1
```

Port	Alg	Q0	Q1	Q2	Q3	Q4	Q5	Q6	Q7
ge.1.1	WRR	2	10	15	20	24	29	SP	SP

8.3.4 Configuring Port Traffic Rate Limiting

Purpose

To limit the rate of inbound traffic on the SecureStack A2 device on a per port/priority basis. The allowable range for the rate limiting is 64 kilobytes per second minimum up to the maximum transmission rate allowable on the interface type.

Rate limit is configured for a given port and list of priorities. The list of priorities can include one, some, or all of the eight 802.1p priority levels. Once configured, the rate of all traffic entering the port with the priorities configured to that port is not allowed to exceed the programmed limit. If the rate exceeds the programmed limit, frames are dropped until the rate falls below the limit.

Commands

The commands to configure traffic rate limiting are listed below and described in the associated section.

- show port ratelimit ([Section 8.3.4.1](#))
- set port ratelimit ([Section 8.3.4.2](#))
- clear port ratelimit ([Section 8.3.4.3](#))

8.3.4.1 show port ratelimit

Use this command to show the traffic rate limiting configuration on one or more ports.

show port ratelimit [*port-string*]

Syntax Description

<i>port-string</i>	(Optional) Displays rate limiting information for specific port(s). For a detailed description of possible <i>port-string</i> values, refer to Section 3.1.1 .
--------------------	--

Command Defaults

If *port-string* is not specified, rate limiting information will be displayed for all ports.

Command Mode

Read-Only.

Example

This example shows how to display the current rate limiting information for fe.2.1:

```
A2(rw)->show port ratelimit fe.2.1
Global Ratelimiting status is disabled.
```

Port Number	Index	Threshold (kB/s)	Action	Direction	Priority List	Status
fe.2.1	1	64	discard	inbound	0	disabled
fe.2.1	2	64	discard	inbound	0	disabled
fe.2.1	3	64	discard	inbound	0	disabled
fe.2.1	4	64	discard	inbound	0	disabled
fe.2.1	5	64	discard	inbound	0	disabled
fe.2.1	6	64	discard	inbound	0	disabled
fe.2.1	7	64	discard	inbound	0	disabled
fe.2.1	8	64	discard	inbound	0	disabled
fe.2.1	9	64	discard	inbound	0	disabled
fe.2.1	10	64	discard	inbound	0	disabled
fe.2.1	11	64	discard	inbound	0	disabled
fe.2.1	12	64	discard	inbound	0	disabled

[Table 8-1](#) shows a detailed explanation of the command output.

Table 8-1 show port ratelimit Output Details

Output	What It Displays...
Port Number	Port designation. For a detailed description of possible <i>port-string</i> values, refer to Section 3.1.1 .
Index	Resource index for this port.
Threshold (kB/s)	Port rate limiting threshold in kilobytes per second.
Action	Whether or not frames not conforming to rate limiting will be discarded.
Direction	Currently rules can only be applied to inbound traffic.
Priority List	802.1D (802.1p) port priority level.
Status	Whether or not this rule is active or disabled.

8.3.4.2 set port ratelimit

Use this command to configure the traffic rate limiting status and threshold (in kilobytes per second) for one or more ports.

```
set port ratelimit {disable | enable} [port-string priority threshold {disable | enable} [inbound] [index]
```

Syntax Description

disable enable	When entered without a <i>port-string</i> , globally disables or enables the port rate limiting function. When entered with a <i>port-string</i> , disables or enables rate limiting on specific port(s) when the global function is enabled.
<i>port-string</i>	Specifies a port on which to set the rate limiting threshold and other parameters. For a detailed description of possible <i>port-string</i> values, refer to Section 3.1.1 .
<i>priority</i>	Specifies the 802.1D (802.1p) port priority level associated with the <i>port-string</i> . The value can be 0 to 7 , with 0 specifying the lowest priority.
<i>threshold</i>	Specifies a port rate limiting threshold in bytes per second. Range is 64 up the maximum of 2,147,483,647 kilobytes per second.
inbound	(Optional) Applies this rate policing rule to inbound traffic.
<i>index</i>	(Optional) Assigns a resource index for this port.

Command Defaults

- Threshold will be applied to inbound traffic on the port/priority.
- If *index* is not specified, settings will be applied to index 1, and will overwrite index 1 for any subsequent rate limits configured.

Command Mode

Read-Write.

Example

This example shows how to:

- globally enable rate limiting
- configure rate limiting for inbound traffic on port fe.2.1, index 1, priority 5, to a threshold of 125 KBps:

```
A2 (rw) -> set port ratelimit enable  
A2 (rw) -> set port ratelimit fe.2.1 5 125 enable inbound
```

8.3.4.3 clear port ratelimit

Use this command to clear rate limiting parameters for one or more ports.

clear port ratelimit *port-string* [*index*]

Syntax Description

<i>port-string</i>	Specifies the port(s) on which to clear rate limiting. For a detailed description of possible <i>port-string</i> values, refer to Section 3.1.1 .
<i>index</i>	(Optional) Specifies the associated resource index to be reset.

Command Defaults

If not specified, all *index* entries will be reset.

Command Mode

Read-Write.

Example

This example shows how to clear all rate limiting parameters on port fe.2.1:

```
A2 (rw) ->clear port ratelimit fe.2.1
```

IGMP Configuration

This chapter describes the IGMP Configuration set of commands and how to use them.

9.1 ABOUT IP MULTICAST GROUP MANAGEMENT

The Internet Group Management Protocol (IGMP) runs between hosts and their immediately neighboring multicast switch device. The protocol's mechanisms allow a host to inform its local switch device that it wants to receive transmissions addressed to a specific multicast group.

A multicast-enabled switch device can periodically ask its hosts if they want to receive multicast traffic. If there is more than one switch device on the LAN performing IP multicasting, one of these devices is elected “querier” and assumes the responsibility of querying the LAN for group members.

Based on the group membership information learned from IGMP, a switch device can determine which (if any) multicast traffic needs to be forwarded to each of its ports. At Layer-3, multicast switch devices use this information, along with a multicast routing protocol, to support IP multicasting across the Internet.

IGMP provides the final step in an IP multicast packet delivery service since it is only concerned with forwarding multicast traffic from the local switch device to group members on a directly attached subnetwork or LAN segment.

This switch device supports IP multicast group management by passively snooping on the IGMP query and IGMP report packets transferred between IP multicast switches and IP multicast host groups to learn IP multicast group members.

The purpose of IP multicast group management is to optimize a switched network's performance so multicast packets will only be forwarded to those ports containing multicast group hosts or multicast switch devices instead of flooding to all ports in the subnet (VLAN).

9.2 IGMP CONFIGURATION SUMMARY

Multicasting is used to support real-time applications such as video conferences or streaming audio. A multicast server does not have to establish a separate connection with each client. It merely broadcasts its service to the network, and any hosts that want to receive the multicast register with their local multicast switch. Although this approach reduces the network overhead required by a multicast server, the broadcast traffic must be carefully pruned at every multicast switch it passes through to ensure that traffic is only passed to the hosts that subscribed to this service.

9.3 PROCESS OVERVIEW: IGMP CONFIGURATION

Use the following steps as a guide in the IGMP configuration process:

1. Enabling / disabling IGMP ([Section 9.4.1](#))
2. Configuring IGMP ([Section 9.4.2](#))

9.4 IGMP CONFIGURATION COMMAND SET

9.4.1 Enabling / Disabling IGMP

Purpose

To display IGMP information and to enable or disable IGMP snooping on the device.

Commands

The commands used to display, enable and disable IGMP are listed below and described in the associated sections as shown.

- show igmpsnooping ([Section 9.4.1.1](#))
- set igmpsnooping adminmode ([Section 9.4.1.2](#))
- set igmpsnooping interfacemode ([Section 9.4.1.3](#))

9.4.1.1 show igmpsnooping

Use this command to display IGMP snooping information. Configured information is displayed whether or not IGMP snooping is enabled. Status information is displayed only when the function is enabled. For information on enabling IGMP on the system, refer to [Section 9.4.1.2](#). For information on enabling IGMP on one or more ports, refer to [Section 9.4.1.3](#).

show igmpsnooping

Syntax Description

None.

Command Defaults

None.

Command Mode

Read-Only.

Example

This example shows how to display IGMP snooping information:

```
A2 (rw) -> show igmpsnooping
Admin Mode..... Enable
Group Membership Interval..... 260
Max Response Time..... 100
Multicast Router Present Expiration Time..... 0
Interfaces Enabled for IGMP Snooping..... fe.1.1, fe.1.2, fe.1.3
                                           fe.1.4, fe.1.5, fe.1.6
Multicast Control Frame Count..... 0
Data Frames Forwarded by the CPU..... 0
```

9.4.1.2 set igmpsnooping adminmode

Use this command to enable or disable IGMP on the system.

NOTE: In order for IGMP snooping to be enabled on one or all ports, it must be globally enabled on the device with this command, and then enabled on a port(s) using the **set igmpsnooping interface mode** command as described in [Section 9.4.1.3](#).

set igmpsnooping adminmode {enable | disable}

Syntax Description

enable disable	Enables or disables IGMP snooping on the system.
-------------------------	--

Command Defaults

None.

Command Mode

Read-Write.

Example

This example shows how to enable IGMP on the system:

```
A2 (rw) -> set igmpsnooping adminmode enable
```

9.4.1.3 set igmpsnooping interfacemode

Use this command to enable or disable IGMP on one or all ports.

NOTE: In order for IGMP snooping to be enabled on one or all ports, it must be globally enabled on the device using the **set igmpsnooping adminmode** command as described in [Section 9.4.1.2](#), and then enabled on a port(s) using this command.

set igmpsnooping interfacemode *port-string* {**enable** | **disable**}

Syntax Description

<i>port-string</i>	Specifies one or more ports on which to enable or disable IGMP.
enable disable	Enables or disables IGMP.

Command Defaults

None.

Command Mode

Read-Write.

Example

This example shows how to enable IGMP on ports fe.1-10:

```
A2 (rw) -> set igmpsnooping interfacemode fe.1-10 enable
```

9.4.2 Configuring IGMP

Purpose

To display and set IGMP configuration parameters, including query interval and response time settings.

Commands

The commands used to configure IGMP are listed below and described in the associated sections as shown.

- `set igmpsnooping groupmembershipinterval` ([Section 9.4.2.1](#))
- `set igmpsnooping maxresponse` ([Section 9.4.2.2](#))
- `set igmpsnooping mcertexpiretime` ([Section 9.4.2.3](#))
- `show igmpsnooping mfdb` ([Section 9.4.2.4](#))
- `clear igmpsnooping` ([Section 9.4.2.5](#))

9.4.2.1 set igmpsnooping groupmembershipinterval

Use this command to configure the IGMP group membership interval time for the system. This value sets the frequency of host-query frame transmissions and must be greater than the IGMP maximum response time as described in [Section 9.4.2.2](#).

set igmpsnooping groupmembershipinterval *time*

Syntax Description

<i>time</i>	Specifies the IGMP group membership interval. Valid values are 2 - 3600 seconds. This value works together with the set igmpsnooping maxresponsetime command to remove ports from an IGMP group and must be greater than the max response time value.
-------------	---

Command Defaults

None.

Command Mode

Read-Write.

Example

This example shows how to set the IGMP group membership interval to 250 seconds:

```
A2 (rw) -> set igmpsnooping groupmembershipinterval 250
```

9.4.2.2 set igmpsnooping maxresponse

Use this command to configure the IGMP query maximum response time for the system. This value must be less than the IGMP maximum response time as described in [Section 9.4.2.1](#).

set igmpsnooping maxresponse *time*

Syntax Description

<i>time</i>	Specifies the IGMP maximum query response time. Valid values are 100 - 255 seconds. This value works together with the set igmpsnooping groupmembershipinterval command to remove ports from an IGMP group and must be less than the group membership interval value.
-------------	---

Command Defaults

None.

Command Mode

Read-Write.

Example

This example shows how to set the IGMP maximum response time to 100 seconds:

A2 (rw) ->**set igmpsnooping maxresponse 100**

9.4.2.3 set igmpsnooping mcrtrexpiretime

Use this command to configure the IGMP multicast router expiration time for the system. This timer is for expiring the switch from the multicast database. If the timer expires, and the only address left is the multicast switch, then the entry will be removed.

set igmpsnooping mcrtrexpire *time*

Syntax Description

<i>time</i>	Specifies the IGMP multicast router expiration time. Valid values are 0 - 3600 seconds. A value of 0 will configure the system with an infinite expiration time.
-------------	---

Command Defaults

None.

Command Mode

Read-Write.

Example

This example shows how to set the IGMP multicast router expiration time to infinity:

```
A2 (rw) -> set igmpsnooping mcrtrexpiretime 0
```

9.4.2.4 show igmpsnooping mfdb

Use this command to display multicast forwarding database (MFDB) information.

show igmpsnooping mfdb [stats]

Syntax Description

stats	(Optional) Displays MFDB statistics.
--------------	--------------------------------------

Command Defaults

If **stats** is not specified, all MFDB table entries will be displayed.

Command Mode

Read-Only.

Examples

This example shows how to display multicast forwarding database entries:

A2 (rw) -> show igmpsnooping mfdb			
MAC Address	Type	Description	Interfaces
-----	-----	-----	-----
00:14:01:00:5E:02:CD:B0	Dynamic	Network Assist	Fwd: fe.1.1, fe.3.1, fe.4.1, fe.5.1, fe.6.2, fe.6.3, fe.7.1, fe.8.1
00:32:01:00:5E:37:96:D0	Dynamic	Network Assist	Fwd: fe.4.7
00:32:01:00:5E:7F:FF:FA	Dynamic	Network Assist	Fwd: fe.4.7

This example shows how to display multicast forwarding database statistics:

A2 (rw) -> show igmpsnooping mfdb stats	
Max MFDB Table Entries.....	256
Most MFDB Entries Since Last Reset.....	1
Current Entries.....	0

9.4.2.5 clear igmpsnooping

Use this command to clear all IGMP snooping entries.

clear igmpsnooping

Syntax Description

None.

Command Defaults

None.

Command Mode

Read-Write.

Example

This example shows how to clear all IGMP snooping entries:

```
A2 (rw) ->clear igmpsnooping
```

Security Configuration

This chapter describes the Security Configuration set of commands and how to use them.

10.1 OVERVIEW OF SECURITY METHODS

The following security methods are available for controlling which users are allowed to access, monitor, and manage the device.

- Login user accounts and passwords – used to log in to the CLI by way of a Telnet connection or local COM port connection. For details, refer to [Section 2.1.11](#).
- Host Access Control Authentication (HACA) – authenticates user access of Telnet management, console local management and WebView via a central RADIUS Client/Server application. When RADIUS is enabled, this essentially overrides login user accounts. When HACA is active with a valid RADIUS configuration, the user names and passwords used to access the switch via Telnet, SSH, Webview, and COM ports will be validated against the configured RADIUS server. Only in the case of a RADIUS timeout will those credentials be compared against credentials locally configured on the switch. For details, refer to [Section 10.3.1](#).
- SNMP user or community names – allows access to the SecureStack A2 switch by way of a network SNMP management application. To access the switch, you must enter an SNMP user or community name string. The level of management access is dependent on the associated access policy. For details, refer to [Chapter 4](#).
- 802.1X Port Based Network Access Control using EAPOL (Extensible Authentication Protocol) – provides a mechanism using a RADIUS server for administrators to securely authenticate and grant appropriate access to end user devices communicating with SecureStack A2 ports. For details on using CLI commands to configure 802.1X, refer to [Section 10.3.2](#).

NOTE: To configure EAP pass-through, which allows client authentication packets to be forwarded through the SecureStack switch to an upstream device, 802.1X authentication must be globally disabled with the **set dot1x** command ([Section 10.3.2.3](#)).

- MAC Authentication – provides a mechanism for administrators to securely authenticate source MAC addresses and grant appropriate access to end user devices communicating on SecureStack A2 ports. For details, refer to [Section 10.3.3](#).
- Multiple Authentication Methods – allows users to authenticate using multiple methods of authentication on the same port. For details, refer to [Section 10.3.4](#).
- RFC 3580 Tunnel Attributes provide a mechanism to contain an 802.1X authenticated user to a VLAN regardless of the PVID, refer to [Section 10.3.5](#).
- MAC Locking – locks a port to one or more MAC addresses, preventing the use of unauthorized devices and MAC spoofing on the port. For details, refer to [Section 10.3.6](#).
- Secure Shell (SSH) – provides secure Telnet. For details, refer to [Section 10.3.7](#).

10.2 PROCESS OVERVIEW: SECURITY CONFIGURATION

Use the following steps as a guide to configuring security methods on the device:

1. Configuring RADIUS ([Section 10.3.1](#))
2. Configuring 802.1X Authentication ([Section 10.3.2](#))
3. Configuring MAC Authentication ([Section 10.3.3](#))
4. Configuring multiple authentication methods ([Section 10.3.4](#))
5. Configuring RFC 3580 RADIUS tunnel attributes ([Section 10.3.5](#))
6. Configuring MAC Locking ([Section 10.3.6](#))
7. Configuring Secure Shell (SSH) ([Section 10.3.7](#))

10.3 SECURITY CONFIGURATION COMMAND SET

10.3.1 Configuring RADIUS

Purpose

To perform the following:

- Review the RADIUS client/server configuration on the switch.
- Enable or disable the RADIUS client.
- Set local and remote login options.
- Set primary and secondary server parameters, including IP address, timeout period, authentication realm, and number of user login attempts allowed.
- Reset RADIUS server settings to default values.
- Configure a RADIUS accounting server.

Commands

The commands used to review and configure RADIUS are listed below and described in the associated section as shown:

- show radius ([Section 10.3.1.1](#))
- set radius ([Section 10.3.1.2](#))
- clear radius ([Section 10.3.1.3](#))
- show radius accounting ([Section 10.3.1.4](#))
- set radius accounting ([Section 10.3.1.5](#))
- clear radius accounting ([Section 10.3.1.6](#))

10.3.1.1 show radius

Use this command to display the current RADIUS client/server configuration.

```
show radius [status | retries | timeout | server [index | all]]
```

Syntax Description

status	(Optional) Displays the RADIUS server’s enable status.
retries	(Optional) Displays the number of retry attempts before the RADIUS server times out.
timeout	(Optional) Displays the maximum amount of time (in seconds) to establish contact with the RADIUS server before retry attempts begin.
server	(Optional) Displays RADIUS server configuration information.
index all	For use with the server parameter to show server configuration for all servers or a specific RADIUS server as defined by an index.

Command Mode

Read-Only.

Command Defaults

If no parameters are specified, all RADIUS configuration information will be displayed.

Example

This example shows how to display RADIUS configuration information:

```
A2 (rw)->show radius
RADIUS status:      Enabled
RADIUS retries:     3
RADIUS timeout:     20 seconds
RADIUS Server       IP Address      Auth-Port  Realm-Type
-----
10                  172.16.20.10  1812      management-access
```

Table 10-1 provides an explanation of the command output.

Table 10-1 show radius Output Details

Output	What It Displays...
RADIUS status	Whether RADIUS is enabled or disabled .
RADIUS retries	Number of retry attempts before the RADIUS server times out. The default value of 3 can be reset using the set radius command as described in Section 10.3.1.2 .
RADIUS timeout	Maximum amount of time (in seconds) to establish contact with the RADIUS server before retry attempts begin. The default value of 20 can be reset using the set radius command as described in Section 10.3.1.2 .
RADIUS Server	RADIUS server's index number, IP address, and UDP authentication port.
Realm-Type	<p>Realm defines who has to go through the RADIUS server for authentication.</p> <ul style="list-style-type: none">• Management-access: This means that anyone trying to access the switch (Telnet, SSH, Local Management) has to authenticate through the RADIUS server.• Network-access: This means that all the users have to authenticate to a RADIUS server before they are allowed access to the network.• Any-access: Means that both Management-access and Network-access have been enabled.

10.3.1.2 set radius

Use this command to enable, disable, or configure RADIUS authentication.

```
set radius {[enable | disable] [retries number-of-retries] [timeout timeout]
[server {indexip-address port [secret-value] [realm {management-access |
any-access | network-access}]]}
```

NOTE: The RADIUS client can only be enabled on the switch once a RADIUS server is online, and its IP address(es) has been configured with the same password the RADIUS client will use.

Syntax Description

enable disable	Enables or disables the RADIUS client.
retries <i>number-of-retries</i>	Specifies the number of retry attempts before the RADIUS server times out. Valid values are from 1 to 10 . Default is 3 .
timeout <i>timeout</i>	Specifies the maximum amount of time (in seconds) to establish contact with the RADIUS server before retry attempts begin. Valid values are from 1 to 30 . Default is 20 seconds.
server <i>index</i> <i>ip_address port</i>	Specifies the index number, IP address and the UDP authentication port for the RADIUS server.
<i>secret-value</i>	(Optional) Specifies an encryption key to be used for authentication between the RADIUS client and server.

realm	Realm allows you to define who has to go through the
management-access	RADIUS server for authentication.
any-access	
network-access	<ul style="list-style-type: none"> • management-access: This means that anyone trying to access the switch (Telnet, SSH, Local Management) has to authenticate through the RADIUS server. • network-access: This means that all the users have to authenticate to a RADIUS server before they are allowed access to the network. • any-access: Means that both Management-access and Network-access have been enabled. <p>NOTE: If the management-access or any-access realm has been configured, the local “admin” account is disabled for access to the switch using the console, Telnet, or Local Management. Only the network-access realm allows access to the local “admin” account.</p>

Command Mode

Read-Write.

Command Defaults

If *secret-value* is not specified, none will be applied.

If **realm** is not specified, the **any-access** realm will be used.

Examples

This example shows how to enable the RADIUS client for authenticating with the RADIUS server at IP address 10.1.6.203, UDP authentication port 1812, and an authentication password of “pwsecret.” As previously noted, the “server secret” password entered here must match that already configured as the Read-Write (rw) password on the RADIUS server:

```
A2 (rw) -> set radius server 1 10.1.6.203 1812 pwsecret
```

This example shows how to set the RADIUS timeout to 5 seconds:

```
A2 (rw) -> set radius timeout 5
```

This example shows how to set RADIUS retries to 10:

```
A2 (rw) -> set radius retries 10
```

This example shows how to force any management-access to the switch (telnet, web, SSH) to authenticate through a RADIUS server. The “all” at the end of the command means that any of the defined RADIUS servers can be used for this Authentication.

```
A2 (rw) -> set radius realm management-access all
```

10.3.1.3 clear radius

Use this command to clear RADIUS server settings.

clear radius [**retries**] [**timeout**] [**server** [**realm**] {*index* | **all**}]

Syntax Description

retries	Resets the maximum number of attempts a user can contact the RADIUS server before timing out to 3 .
timeout	Resets the maximum amount of time to establish contact with the RADIUS server before timing out to 20 seconds.
server	Deletes the RADIUS server settings.
realm	(Optional) Resets the realm setting to the any-access authentication.
<i>index</i> all	For use with the server parameter to clear the server configuration for all servers or a specific RADIUS server as defined by an index.

Command Mode

Read-Write.

Command Defaults

None.

Examples

This example shows how to clear all settings on all RADIUS servers:

```
A2 (rw) ->clear radius server all
```

This example shows how to reset the RADIUS timeout to the default value of 20 seconds:

```
A2 (rw) ->clear radius timeout
```

10.3.1.4 show radius accounting

Use this command to display the RADIUS accounting configuration. This transmits accounting information between a network access server and a shared accounting server.

```
show radius accounting [server | counter ip-address | retries | timeout]
```

Syntax Description

server	(Optional) Displays one or all RADIUS accounting server configurations.
counter <i>ip-address</i>	(Optional) Displays counters for a RADIUS accounting server.
retries	(Optional) Displays the maximum number of attempts to contact the RADIUS accounting server before timing out.
timeout	(Optional) Display the maximum amount of time before timing out.

Command Mode

Read-Only.

Command Defaults

If no parameters are specified, all RADIUS accounting configuration information will be displayed.

Example

This example shows how to display RADIUS accounting configuration information. In this case, RADIUS accounting is not currently enabled and global default settings have not been changed. One server has been configured. The SecureStack A2 switch allows for up to 10 RADIUS accounting servers to be configured, with up to 2 active at any given time.

For details on enabling and configuring RADIUS accounting, refer to [Section 10.3.1.5](#):

```
A2 (ro)->show radius accounting
RADIUS accounting status:      Disabled
RADIUS Acct Server  IP Address  Acct-Port  Retries  Timeout  Status
-----
1                   172.16.2.10 1856       3        20      Disabled
```

10.3.1.5 set radius accounting

Use this command to configure RADIUS accounting.

```
set radius accounting {[enable | disable] [retries retries] [timeout timeout]  
[server ip_address port [server-secret]]}
```

Syntax Description

enable disable	Enables or disables the RADIUS accounting client.
retries <i>retries</i>	Sets the maximum number of attempts to contact a specified RADIUS accounting server before timing out. Valid retry values are 1 - 10 .
timeout <i>timeout</i>	Sets the maximum amount of time (in seconds) to establish contact with a specified RADIUS accounting server before timing out. Valid timeout values are 1 - 30 .
server <i>ip_address port server-secret</i>	Specifies the accounting server's: <ul style="list-style-type: none">• IP address• UDP authentication port (0 - 65535)• <i>server-secret</i> (Read-Write password to access this accounting server. Switch will prompt for this entry upon creating a server instance, as shown in the example below.)

Command Mode

Read-Write.

Command Defaults

None.

Examples

This example shows how to enable the RADIUS accounting client for authenticating with the accounting server at IP address 10.2.4.12, UDP authentication port 1800. As previously noted, the “server secret” password entered here must match that already configured as the Read-Write (rw) password on the RADIUS accounting server:

```
A2 (rw) ->set radius accounting server 12.12.12.1 1800  
Enter secret:  
Re-enter secret:
```

This example shows how to set the RADIUS accounting timeout to 30 seconds:

```
A2 (rw) -> set radius accounting timeout 30
```

This example shows how to set RADIUS accounting retries to 10:

```
A2 (rw) -> set radius accounting retries 10
```

10.3.1.6 clear radius accounting

Use this command to clear RADIUS accounting configuration settings.

clear radius accounting {**server** *ip-address* | **retries** | **timeout** | **counter**}

Syntax Description

server <i>ip-address</i>	Clears the configuration on one or more accounting servers.
retries	Resets the retries to the default value of 2.
timeout	Resets the timeout to 5 seconds.
counter	Clears counters.

Command Mode

Read-Write.

Command Defaults

None.

Example

This example shows how to reset the RADIUS accounting timeout to 5 seconds:

```
A2 (rw) ->clear radius accounting timeout
```

10.3.2 Configuring 802.1X Authentication

Purpose

To review and configure 802.1X authentication for one or more ports using EAPOL (Extensible Authentication Protocol). 802.1X controls network access by enforcing user authorization on selected ports, which results in allowing or denying network access according to RADIUS server configuration.

NOTES: One user per EAPOL-configured port can be authenticated on SecureStack A2 devices.

To configure EAP pass-through, which allows client authentication packets to be forwarded through the SecureStack switch to an upstream device, 802.1X authentication must be globally disabled with the **set dot1x** command ([Section 10.3.2.3](#)).

Commands

The commands used to review and configure 802.1X are listed below and described in the associated section as shown:

- show dot1x ([Section 10.3.2.1](#))
- show dot1x auth-config ([Section 10.3.2.2](#))
- set dot1x ([Section 10.3.2.3](#))
- set dot1x auth-config ([Section 10.3.2.4](#))
- clear dot1x auth-config ([Section 10.3.2.5](#))
- show eapol ([Section 10.3.2.6](#))
- set eapol ([Section 10.3.2.7](#))
- clear eapol ([Section 10.3.2.8](#))

10.3.2.1 show dot1x

Use this command to display 802.1X status, diagnostics, statistics, and reauthentication or initialization control information for one or more ports.

```
show dot1x [auth-config] [auth-diag] [auth-stats] [port [init | reauth]]  
[port-string]
```

Syntax Description

auth-config	(Optional) Display 802.1X authentication parameters.
auth-diag	(Optional) Displays authentication diagnostics information.
auth-stats	(Optional) Displays authentication statistics.
port init reauth	(Optional) Display the protocol version and initialization control for the port.
<i>port-string</i>	(Optional) Displays information for specific port(s). For a detailed description of possible <i>port-string</i> values, refer to Section 3.1.1 .

Command Mode

Read-Only.

Command Defaults

- If no parameters are specified, 802.1X status will be displayed.
- If *port-string* is not specified, information for all ports will be displayed.

Examples

This example shows how to display 802.1X status:

```
A2 (rw) -> show dot1x  
DOT1X is disabled.
```

This example shows how to display authentication diagnostics information for fe.1.1:

```
A2 (rw) -> show dot1x auth-diag fe.1.1

Port : 1    Auth-Diag
Enter Connecting:                                0
EAP Logoffs While Connecting:                    0
Enter Authenticating:                            0
Success While Authenticating                      0
Timeouts While Authenticating:                    0
Fails While Authenticating:                      0
ReAuths While Authenticating:                    0
EAP Starts While Authenticating:                  0
EAP logoff While Authenticating:                  0
Backend Responses:                               0
Backend Access Challenges:                        0
Backend Others Requests To Supp:                  0
Backend NonNak Responses From:                    0
Backend Auth Successes:                          0
Backend Auth Fails:                              0
```

This example shows how to display authentication statistics for fe.1.1:

```
A2 (rw) -> show dot1x auth-stats fe.1.1

Port: 1    Auth-Stats
EAPOL Frames Rx:                                0
EAPOL Frames Tx:                                0
EAPOL Start Frames Rx:                          0
EAPOL Logoff Frames Rx:                          0
EAPOL RespId Frames Rx:                          0
EAPOL Resp Frames Rx:                            0
EAPOL Req Frames Tx:                              0
EAP Length Error Frames Rx:                       0
Last EAPOL Frame Version:                         0
Last EAPOL Frame Source:                         00:00:00:00:00:00
```

This example shows how to display the status of port reauthentication control for fe.1.1 through fe.1.6:

```
A2 (rw) -> show dot1x port reauth fe.1.1-6  
Port 1: Port reauthenticate:      FALSE  
Port 2: Port reauthenticate:      FALSE  
Port 3: Port reauthenticate:      FALSE  
Port 4: Port reauthenticate:      FALSE  
Port 5: Port reauthenticate:      FALSE  
Port 6: Port reauthenticate:      FALSE
```

10.3.2.2 show dot1x auth-config

Use this command to display 802.1X authentication configuration settings for one or more ports.

```
show dot1x auth-config [authcontrolled-portcontrol] [maxreq] [quietperiod]
[reauthenabled] [reauthperiod] [servertimeout] [supptimeout] [txperiod]
[port-string]
```

Syntax Description

authcontrolled-portcontrol	(Optional) Displays the current value of the controlled Port control parameter for the port.
maxreq	(Optional) Displays the value set for maximum requests currently in use by the backend authentication state machine.
quietperiod	(Optional) Displays the value set for quiet period currently in use by the authenticator PAE state machine.
reauthenabled	(Optional) Displays the state of reauthentication control used by the Reauthentication Timer state machine.
reauthperiod	(Optional) Displays the value, in seconds, set for the reauthentication period used by the reauthentication timer state machine.
servertimeout	(Optional) Displays the server timeout value, in seconds, currently in use by the backend authentication state machine.
supptimeout	(Optional) Displays the authentication supplicant timeout value, in seconds, currently in use by the backend authentication state machine.
txperiod	(Optional) Displays the transmission period value, in seconds, currently in use by the authenticator PAE state machine.
<i>port-string</i>	(Optional) Limits the display of desired information information to specific port(s). For a detailed description of possible <i>port-string</i> values, refer to Section 3.1.1 .

Command Mode

Read-Only.

Command Defaults

- If no parameters are specified, all 802.1X settings will be displayed.
- If *port-string* is not specified, information for all ports will be displayed.

Examples

This example shows how to display the EAPOL port control mode for fe.1.1:

```
A2(rw)->show dot1x auth-config authcontrolled-portcontrol fe.1.1
Port 1: Auth controlled port control:          Auto
```

This example shows how to display the 802.1X quiet period settings for fe.1.1:

```
A2(rw)->show dot1x auth-config quietperiod fe.1.1
Port 1: Quiet period:          30
```

This example shows how to display all 802.1X authentication configuration settings for fe.1.1:

```
A2(rw)->show dot1x auth-config fe.1.1
Port : 1      Auth-Config
PAE state:                    Initialize
Backend auth state:          Initialize
Admin controlled directions:  Both
Oper controlled directions:   Both
Auth controlled port status:  Authorized
Auth controlled port control: Auto
Quiet period:                 60
Transmission period:         30
Supplicant timeout:          30
Server timeout:              30
Maximum requests:            2
Reauthentication period:     3600
Reauthentication control:     Disabled
```

10.3.2.3 set dot1x

Use this command to enable or disable 802.1X authentication, to reauthenticate one or more access entities, or to reinitialize one or more supplicants.

Disabling 802.1X authentication globally, by not entering a specific *port-string* value, will enable the EAP pass-through feature. EAP pass-through allows client authentication packets to be forwarded unmodified through the SecureStack switch to an upstream device.

set dot1x {enable | disable | [port {init | reauth} {true | false} *port-string*]}

Syntax Description

enable disable	Enables or disables 802.1X.
port	Enable or disable 802.1X reauthentication or initialization control.
init reauth	Configure initialization or reauthentication control.
true false	Enables (true) or disables (false) reinitialization/reauthentication.
<i>port-string</i>	(Optional) Specifies the port(s) to reinitialize or reauthenticate.

Command Mode

Read-Write.

Command Defaults

If no ports are specified, the reinitialization or reauthentication setting will be applied to all ports.

Examples

This example shows how to enable 802.1X:

```
A2 (rw) ->set dot1x enable
```

This example shows how to reinitialize fe.1.2:

```
A2 (rw) ->set dot1x port init true fe.1.2
```

10.3.2.4 set dot1x auth-config

Use this command to configure 802.1X authentication.

```
set dot1x auth-config {[maxreq value] [quietperiod value] [reauthenable
{false | true}] [reauthperiod value] [servertimeout timeout] [supptimeout
timeout] [txperiod value]} [port-string]
```

Syntax Description

maxreq <i>value</i>	Specifies the maximum number of authentication requests allowed by the backend authentication state machine. Valid values are 1 - 2147483647 .
quietperiod <i>value</i>	Specifies the time (in seconds) following a failed authentication before another attempt can be made by the authenticator PAE state machine. Valid values are 1 - 2147483647 .
reauthenable false true	Enables (true) or disables (false) reauthentication control of the reauthentication timer state machine.
reauthperiod <i>value</i>	Specifies the time lapse (in seconds) between attempts by the reauthentication timer state machine to reauthenticate a port. Valid values are 1 - 2147483647 .
servertimeout <i>timeout</i>	Specifies a timeout period (in seconds) for the authentication server, used by the backend authentication state machine. Valid values are 1 - 2147483647 .
supptimeout <i>timeout</i>	Specifies a timeout period (in seconds) for the authentication supplicant used by the backend authentication state machine. Valid values are 1 - 2147483647 .
txperiod <i>value</i>	Specifies the period (in seconds) which passes between authenticator PAE state machine EAP transmissions. Valid values are 1 - 2147483647 .
<i>port-string</i>	(Optional) Limits the configuration of desired settings to specified port(s). For a detailed description of possible <i>port-string</i> values, refer to Section 3.1.1 .

Command Mode

Read-Write.

Command Defaults

If *port-string* is not specified, authentication parameters will be set on all ports.

Examples

This example shows how to enable reauthentication control on ports fe.1.1-3:

```
A2 (rw) -> set dot1x auth-config reauthenable true fe.1.1-3
```

This example shows how to set the 802.1X quiet period to 120 seconds on ports fe.1.1-3:

```
A2 (rw) -> set dot1x auth-config quietperiod 120 fe.1.1-3
```

10.3.2.5 clear dot1x auth-config

Use this command to reset 802.1X authentication parameters to default values on one or more ports.

```
clear dot1x auth-config [authcontrolled-portcontrol] [maxreq] [quietperiod]  
[reauthenable] [reauthperiod] [servertimeout] [supptimeout] [txperiod]  
[port-string]
```

Syntax Description

authcontrolled-portcontrol	(Optional) Resets the 802.1X port control mode to auto .
maxreq	(Optional) Resets the maximum requests value to 2 .
quietperiod	(Optional) Resets the quiet period value to 60 seconds.
reauthenable	(Optional) Resets the reauthentication control state to disabled (false).
reauthperiod	(Optional) Resets the reauthentication period value to 3600 seconds.
servertimeout	(Optional) Resets the server timeout value to 30 seconds.
supptimeout	(Optional) Resets the authentication supplicant timeout value to 30 seconds.
txperiod	(Optional) Resets the transmission period value to 30 seconds.
<i>port-string</i>	(Optional) Resets settings on specific port(s). For a detailed description of possible <i>port-string</i> values, refer to Section 3.1.1 .

Command Mode

Read-Write.

Command Defaults

- If no parameters are specified, all authentication parameters will be reset.
- If no *port-string* is entered, the action will be a global setting.

Examples

This example shows how to reset the 802.1X port control mode to auto on all ports:

```
A2 (rw) ->clear dot1x auth-config authcontrolled-portcontrol
```

This example shows how to reset reauthentication control to disabled on ports fe.1.1-3:

```
A2 (rw) ->clear dot1x auth-config reauthenabed fe.1.1-3
```

This example shows how to reset the 802.1X quiet period to 60 seconds on ports fe.1.1-3:

```
A2 (rw) ->clear dot1x auth-config quietperiod fe.1.1-3
```

10.3.2.6 show eapol

Use this command to display EAPOL status or settings for one or more ports.

show eapol [*port-string*]

Syntax Description

<i>port-string</i>	(Optional) Displays EAPOL status for specific port(s). For a detailed description of possible <i>port-string</i> values, refer to Section 3.1.1 .
--------------------	---

Command Mode

Read-Only.

Command Defaults

If *port-string* is not specified, only EAPOL enable status will be displayed.

Example

This example shows how to display EAPOL status for ports fe.1.1-3:

```
A2 (rw) ->show eapol fe.1.1-3
EAPOL is disabled.

Port          Authentication State      Authentication Mode
-----
fe.1.1        Initialized                Auto
fe.1.2        Initialized                Auto
fe.1.3        Initialized                Auto
```

[Table 10-2](#) provides an explanation of the command output. For details on using the **set eapol** command to enable the protocol and assign an authentication mode, refer to [Section 10.3.2.7](#).

Table 10-2 show eapol Output Details

Output	What It Displays...
Port	Port designation. For a detailed description of possible <i>port-string</i> values, refer to Section 3.1.1 .

Table 10-2 show eapol Output Details (Continued)

Output	What It Displays...
Authentication State	<p>Current EAPOL authentication state for each port. Possible internal states for the authenticator (switch) are:</p> <ul style="list-style-type: none">• initialized: A port is in the initialize state when:<ul style="list-style-type: none">a. authentication is disabled,b. authentication is enabled and the port is not linked, orc. authentication is enabled and the port is linked. (In this case very little time is spent in this state, it immediately transitions to the connecting state, via disconnected.• disconnected: The port passes through this state on its way to connected whenever the port is reinitialized, via link state change, reauthentication failure, or management intervention.• connecting: While in this state, the authenticator sends request/ID messages to the end user.• authenticating: The port enters this state from connecting after receiving a response/ID from the end user. It remains in this state until the entire authentication exchange between the end user and the authentication server completes.• authenticated: The port enters this state from authenticating state after the exchange completes with a favorable result. It remains in this state until linkdown, logoff, or until a reauthentication begins.• aborting: The port enters this state from authenticating when any event occurs that interrupts the login exchange.• held: After any login failure the port remains in this state for the number of seconds equal to quietPeriod (can be set using MIB).• forceAuth: Management is allowing normal, unsecured switching on this port.• forceUnauth: Management is preventing any frames from being forwarded to or from this port.

Table 10-2 show eapol Output Details (Continued)

Output	What It Displays...
Authentication Mode	<p>Mode enabling network access for each port. Modes include:</p> <ul style="list-style-type: none">• Auto: Frames are forwarded according to the authentication state of each port.• Forced Authorized Mode: Meant to disable authentication on a port. It is intended for ports that support ISLs and devices that cannot authenticate, such as printers and file servers. If a default policy is applied to the port via the policy profile MIB, then frames are forwarded according to the configuration set by that policy, otherwise frames are forwarded according to the current configuration for that port. Authentication using 802.1X is not possible on a port in this mode.• Forced Unauthorized Mode: All frames received on the port are discarded by a filter. Authentication using 802.1X is not possible on a port in this mode.

10.3.2.7 set eapol

Use this command to enable or disable EAPOL port-based user authentication with the RADIUS server and to set the authentication mode for one or more ports.

```
set eapol [enable | disable] [auth-mode {auto | forced-auth | forced-unauth}
port-string]
```

Syntax Description

enable disable	Enables or disables EAPOL.
auth-mode	Specifies the authentication mode as:
auto	<ul style="list-style-type: none">auto - Auto authorization mode. This is the default mode and will forward frames according to the authentication state of the port. For details on this mode, refer to Table 10-2.forced-auth - Forced authorized mode, which disables authentication on the port.forced-unauth - Forced unauthorized mode, which filters and discards all frames received on the port.
forced-auth	
forced-unauth	
<i>port-string</i>	Specifies the port(s) on which to set EAPOL parameters. For a detailed description of possible <i>port-string</i> values, refer to Section 3.1.1 .

Command Mode

Read-Write.

Command Defaults

None.

Examples

This example shows how to enable EAPOL:

```
A2 (rw) ->set eapol enable
```

This example shows how to enable EAPOL with forced authorized mode on port fe.1.1:

```
A2 (rw) ->set eapol auth-mode forced-auth fe.1.1
```

10.3.2.8 clear eapol

Use this command to globally clear the EAPOL authentication mode, or to clear settings for one or more ports.

clear eapol [**auth-mode**] [*port-string*]

Syntax Description

auth-mode	(Optional) Globally clears the EAPOL authentication mode.
<i>port-string</i>	(Optional) Specifies the port(s) on which to clear EAPOL parameters. For a detailed description of possible <i>port-string</i> values, refer to Section 3.1.1 .

Command Mode

Read-Write.

Command Defaults

- If **auth-mode** is not specified, all EAPOL settings will be cleared.
- If not specified, settings will be cleared for all ports.

Example

This example shows how to clear the EAPOL authentication mode:

```
A2 (rw) ->clear eapol auth-mode
```

10.3.3 Configuring MAC Authentication

Purpose

To review, disable, enable, and configure MAC authentication. This feature allows the switch to authenticate source MAC addresses in an exchange with an authentication server. The authenticator (switch) takes the source MAC seen on a MAC-authentication enabled port and submits it to a backend client for authentication. The backend client uses the MAC address stored password, if required, as credentials for an authentication attempt. If accepted, a string representing an access policy may be returned. If present, the switch applies the associated policy rules.

NOTE: A2 switches only support authentication of one MAC address per port.

Commands

The commands needed to review, enable, disable, and configure MAC authentication are listed below and described in the associated section as shown:

- show macauthentication ([Section 10.3.3.1](#))
- show macauthentication session ([Section 10.3.3.2](#))
- set macauthentication ([Section 10.3.3.3](#))
- set macauthentication password ([Section 10.3.3.4](#))
- clear macauthentication password ([Section 10.3.3.5](#))
- set macauthentication port ([Section 10.3.3.6](#))
- clear macauthentication authallocated ([Section 10.3.3.7](#))
- set macauthentication portinitialize ([Section 10.3.3.8](#))
- set macauthentication macinitialize ([Section 10.3.3.9](#))
- set macauthentication reauthentication ([Section 10.3.3.10](#))
- set macauthentication portreauthenticate ([Section 10.3.3.11](#))
- set macauthentication macreauthenticate ([Section 10.3.3.12](#))
- set macauthentication reauthperiod ([Section 10.3.3.13](#))
- clear macauthentication reauthperiod ([Section 10.3.3.14](#))

- set macauthentication portquietperiod ([Section 10.3.3.15](#))
- clear macauthentication portquietperiod ([Section 10.3.3.16](#))

10.3.3.1 show macauthentication

Use this command to display MAC authentication information for one or more ports.

```
show macauthentication [port-string]
```

Syntax Description

<i>port-string</i>	(Optional) Displays MAC authentication information for specific port(s). For a detailed description of possible <i>port-string</i> values, refer to Section 3.1.1 .
--------------------	---

Command Mode

Read-Only.

Command Defaults

If *port-string* is not specified, MAC authentication information will be displayed for all ports.

Example

This example shows how to display MAC authentication information for fe.2.1 through 8:

A2 (su) -> show macauthentication fe.2.1-8					
MAC authentication:		- enabled			
MAC user password:		- NOPASSWORD			
Port username significant bits		- 48			
Port	Port State	Reauth Period	Auth Allowed	Auth Allocated	Reauthentications
-----		-----			-----
fe.2.1	disabled	3600	1	1	disabled
fe.2.2	disabled	3600	1	1	disabled
fe.2.3	disabled	3600	1	1	disabled
fe.2.4	disabled	3600	1	1	disabled
fe.2.5	disabled	3600	1	1	disabled
fe.2.6	disabled	3600	1	1	disabled
fe.2.7	disabled	3600	1	1	disabled
fe.2.8	disabled	3600	1	1	disabled

[Table 10-3](#) provides an explanation of the command output.

Table 10-3 show macauthentication Output Details

Output	What It Displays...
MAC authentication	Whether MAC authentication is globally enabled or disabled. Set using the set macauthentication command as described in Section 10.3.3.3 .
MAC user password	User password associated with MAC authentication on the switch. Set using the set macauthentication password command as described in Section 10.3.3.4 .
Port username significant bits	Number of significant bits in the MAC addresses to be used starting with the left-most bit of the vendor portion of the MAC address. The significant portion of the MAC address is sent as a user-name credential when the primary attempt to authenticate the full MAC address fails. Any other failure to authenticate the full address, (i.e., authentication server timeout) causes the next attempt to start once again with a full MAC authentication. Default is 48 and cannot be reset.
Port	Port designation. For a detailed description of possible <i>port-string</i> values, refer to Section 3.1.1 .
Port State	Whether or not MAC authentication is enabled or disabled on this port.
Reauth Period	Reauthentication period for this port. Default value of 30 can be changed using the set macauthentication reauthperiod command described in Section 10.3.3.13 .
Auth Allowed	Number of concurrent authentications supported on this port. Default is 1 and cannot be reset.
Auth Allocated	Maximum number of MAC authentications permitted on this port. Default is 1 and cannot be reset
Reauthentications	Whether or not reauthentication is enabled or disabled on this port. Set using the set macauthentication reauthentication command described in Section 10.3.3.10 .

10.3.3.2 show macauthentication session

Use this command to display the active MAC authenticated sessions.

show macauthentication session

Syntax Description

None.

Command Mode

Read-Only.

Command Defaults

If *port-string* is not specified, MAC session information will be displayed for all MAC authentication ports.

Example

This example shows how to display MAC session information:

A2(su)-> show macauthentication session					
Port	MAC Address	Duration	Reauth Period	Reauthentications	
----	-----	-----	-----	-----	
fe.1.2	00:60:97:b5:4c:07	0,00:52:31	3600	disabled	

[Table 10-4](#) provides an explanation of the command output.

Table 10-4 show macauthentication session Output Details

Output	What It Displays...
Port	Port designation. For a detailed description of possible <i>port-string</i> values, refer to Section 3.1.1 .
MAC Address	MAC address associated with the session.
Duration	Time this session has been active.
Reauth Period	Reauthentication period for this port, set using the set macauthentication reauthperiod command described in Section 10.3.3.13 .
Reauthentications	Whether or not reauthentication is enabled or disabled on this port. Set using the set macauthentication reauthentication command described in Section 10.3.3.10 .

10.3.3.3 set macauthentication

Use this command to globally enable or disable MAC authentication.

set macauthentication {enable | disable}

Syntax Description

enable disable	Globally enables or disables MAC authentication.
-------------------------	--

Command Mode

Read-Write.

Command Defaults

None.

Example

This example shows how to globally enable MAC authentication:

```
A2 (su) -> set macauthentication enable
```

10.3.3.4 set macauthentication password

Use this command to set a MAC authentication password.

set macauthentication password *password*

Syntax Description

<i>password</i>	Specifies a text string MAC authentication password.
-----------------	--

Command Mode

Read-Write.

Command Defaults

None.

Example

This example shows how to set the MAC authentication password to “macauth”:

```
A2 (su) -> set macauthentication password macauth
```

10.3.3.5 clear macauthentication password

Use this command to clear the MAC authentication password.

clear macauthentication password

Syntax Description

None.

Command Mode

Read-Write.

Command Defaults

None.

Example

This example shows how to clear the MAC authentication password:

```
A2 (su) ->clear macauthentication password
```

10.3.3.6 set macauthentication port

Use this command to enable or disable one or more ports for MAC authentication.

set macauthentication port {enable | disable} port-string

NOTE: Enabling port(s) for MAC authentication requires globally enabling MAC authentication on the switch as described in [Section 10.3.3.3](#), and then enabling it on a port-by-port basis. By default, MAC authentication is globally disabled and disabled on all ports.

Syntax Description

enable disable	Enables or disables MAC authentication.
<i>port-string</i>	Specifies port(s) on which to enable or disable MAC authentication. For a detailed description of possible <i>port-string</i> values, refer to Section 3.1.1 .

Command Mode

Read-Write.

Command Defaults

None.

Example

This example shows how to enable MAC authentication on fe.2.1 though 5:

```
A2 (su) -> set macauthentication port enable fe.2.1-5
```

10.3.3.7 clear macauthentication authallocated

Use this command to clear the number of MAC authentication sessions allowed for one or more ports.

clear macauthentication authallocated [*port-string*]

Syntax Description

<i>port-string</i>	(Optional) Clears the number of authentication sessions allowed for specific port(s). For a detailed description of possible <i>port-string</i> values, refer to Section 3.1.1 .
--------------------	--

Command Mode

Read-Write.

Command Defaults

If *port-string* is not specified the number of allowed authentication sessions will be cleared on all ports.

Example

This example shows how to clear the number of allowed MAC authentication sessions on fe.2.1:

```
A2 (su) ->clear macauthentication authallocated fe.2.1
```

10.3.3.8 set macauthentication portinitialize

Use this command to force one or more MAC authentication ports to re-initialize and remove any currently active sessions on those ports.

set macauthentication portinitialize *port-string*

Syntax Description

<i>port-string</i>	Specifies the MAC authentication port(s) to re-initialize. For a detailed description of possible <i>port-string</i> values, refer to Section 3.1.1 .
--------------------	---

Command Mode

Read-Write.

Command Defaults

None.

Example

This example shows how to force fe.2.1 through 5 to initialize:

A2 (su) ->**set macauthentication portinitialize fe.2.1-5**

10.3.3.9 **set macauthentication macinitialize**

Use this command to force a current MAC authentication session to re-initialize and remove the session.

set macauthentication macinitialize *mac_addr*

Syntax Description

<i>mac_addr</i>	Specifies the MAC address of the session to re-initialize.
-----------------	--

Command Mode

Read-Write.

Command Defaults

None.

Example

This example shows how to force the MAC authentication session for address 00-60-97-b5-4c-07 to re-initialize:

```
A2 (su) -> set macauthentication macinitialize 00-60-97-b5-4c-07
```

10.3.3.10 set macauthentication reauthentication

Use this command to enable or disable reauthentication of all currently authenticated MAC addresses on one or more ports.

set macauthentication reauthentication {enable | disable} *port-string*

Syntax Description

enable disable	Enables or disables MAC reauthentication.
<i>port-string</i>	Specifies port(s) on which to enable or disable MAC reauthentication. For a detailed description of possible <i>port-string</i> values, refer to Section 3.1.1 .

Command Mode

Read-Write.

Command Defaults

None.

Example

This example shows how to enable MAC reauthentication on fe.4.1 though 5:

A2 (su) ->**set macauthentication reauthentication enable fe.4.1-5**

10.3.3.11 set macauthentication portreauthenticate

Use this command to force an immediate reauthentication of the currently active sessions on one or more MAC authentication ports.

set macauthentication portreauthenticate *port-string*

Syntax Description

<i>port-string</i>	Specifies MAC authentication port(s) to be reauthenticated. For a detailed description of possible <i>port-string</i> values, refer to Section 3.1.1 .
--------------------	--

Command Mode

Read-Write.

Command Defaults

None.

Example

This example shows how to force fe.2.1 through 5 to reauthenticate:

```
A2 (su) -> set macauthentication portreauthentication fe.2.1-5
```

10.3.3.12 set macauthentication macreauthenticate

Use this command to force an immediate reauthentication of a MAC address.

set macauthentication macreauthenticate *mac_addr*

Syntax Description

<i>mac_addr</i>	Specifies the MAC address of the session to reauthenticate.
-----------------	---

Command Mode

Read-Write.

Command Defaults

None.

Example

This example shows how to force the MAC authentication session for address 00-60-97-b5-4c-07 to reauthenticate:

```
A2 (su) ->set macauthentication macreauthenticate 00-60-97-b5-4c-07
```

10.3.3.13 set macauthentication reauthperiod

Use this command to set the MAC reauthentication period (in seconds). This is the time lapse between attempts to reauthenticate any current MAC address authenticated to a port.

set macauthentication reauthperiod *time port-string*

Syntax Description

<i>time</i>	Specifies the number of seconds between reauthentication attempts. Valid values are 1 - 4294967295 .
<i>port-string</i>	Specifies the port(s) on which to set the MAC reauthentication period. For a detailed description of possible <i>port-string</i> values, refer to Section 3.1.1 .

Command Mode

Read-Write.

Command Defaults

None.

Example

This example shows how to set the MAC reauthentication period to 7200 seconds (2 hours) on fe.2.1 through 5:

```
A2 (su) -> set macauthentication reauthperiod 7200 fe.2.1-5
```

10.3.3.14 clear macauthentication reauthperiod

Use this command to clear the MAC reauthentication period on one or more ports.

clear macauthentication reauthperiod [*port-string*]

Syntax Description

<i>port-string</i>	(Optional) Clears the MAC reauthentication period on specific port(s). For a detailed description of possible <i>port-string</i> values, refer to Section 3.1.1 .
--------------------	---

Command Mode

Read-Write.

Command Defaults

If port-string is not specified, the reauthentication period will be cleared on all ports.

Example

This example shows how to globally clear the MAC reauthentication period:

A2 (rw) ->**clear macauthentication reauthperiod**

10.3.3.15 set macauthentication portquietperiod

Use this command to set the number of seconds following a failed authentication before another attempted may be made on the port.

set macauthentication portquietperiod *time* [*port-string*]

Syntax Description

<i>time</i>	Quiet period in seconds between authentication attempts
<i>port-string</i>	Specifies the port(s) on which to set the quiet period. For a detailed description of possible <i>port-string</i> values, refer to Section 3.1.1 .

Command Mode

Read-Write.

Command Defaults

None.

Example

This example shows how to set the quiet period after a failed authentication attempt to 5 seconds for ports fe.1.1-20:

```
A2 (rw) -> set macauthentication portquietperiod 5 fe.1.1-20
```

10.3.3.16 clear macauthentication portquietperiod

Use this command to clear the number of seconds following a failed authentication before another attempted may be made on the port to the default setting.

```
set macauthentication portquietperiod time [port-string]
```

Syntax Description

<i>time</i>	Quiet period in seconds between authentication attempts
<i>port-string</i>	Specifies the port(s) on which to set the quiet period. For a detailed description of possible <i>port-string</i> values, refer to Section 3.1.1 .

Command Mode

Read-Write.

Command Defaults

None.

Example

This example shows how to clear the quiet period for ports fe.1.1-20:

```
A2 (rw) ->clear macauthentication portquietperiod fe.1.1-20
```

10.3.4 Configuring Multiple Authentication Methods

About Multiple Authentication

When enabled, multiple authentication allows users to authenticate using up to two methods on the same port. In order for multiple authentication to function on the device, each possible method of authentication (MAC authentication, 802.1X) must be enabled globally and configured appropriately on the desired ports with its corresponding command set described in this chapter.

Multiple authentication mode must be globally enabled on the device using the **set multiauth mode** command as described in [Section 10.3.4.2](#).

Purpose

To review, enable, disable, and configure multiple authentication on ports.

Commands

The commands to configure multiple authentication are:

- show multiauth ([Section 10.3.4.1](#))
- set multiauth mode ([Section 10.3.4.2](#))
- clear multiauth mode ([Section 10.3.4.3](#))
- set multiauth precedence ([Section 10.3.4.4](#))
- clear multiauth precedence ([Section 10.3.4.5](#))
- show multiauth port ([Section 10.3.4.6](#))
- set multiauth port ([Section 10.3.4.7](#))
- clear multiauth port ([Section 10.3.4.8](#))
- show multiauth station ([Section 10.3.4.9](#))

10.3.4.1 show multiauth

Use this command to display multiple authentication system configuration

show multiauth

Syntax Description

None.

Command Mode

Read-Only.

Command Defaults

None.

Example

This example shows how to display multiple authentication system configuration:

```
A2 (rw) ->show multiauth

Multiple authentication system configuration
-----
Supported types           : dot1x, mac
Maximum number of users  : 280
Current number of users   : 3
System mode               : strict
Default precedence       : dot1x, mac
Admin precedence         :
Operational precedence   : dot1x, mac
```

10.3.4.2 set multiauth mode

Use this command to set the system authentication mode to allow multiple authentication modes simultaneously (802.1x and MAC Authentication) on a single port, or to strictly adhere to 802.1x authentication.

set multiauth mode {multi | strict}

Syntax Description

multi	Allow the system to use multiple authentication modes simultaneously (802.1x and MAC Authentication) on a port. This is the default mode.
strict	User must authenticate using 802.1x authentication before normal traffic (anything other than authentication traffic) can be forwarded.

NOTE: Multiauth multi mode requires that MAC and 802.1X authentication be enabled globally, and configured appropriately on the desired ports according to their corresponding command sets described in this chapter (Refer to [Section 10.3.2, “Configuring 802.1X Authentication,”](#) on [page 10-14](#) and [Section 10.3.3, “Configuring MAC Authentication,”](#) on [page 10-30](#).)

Command Mode

Read-Write.

Command Defaults

None.

Example

This example shows how to enable simultaneous multiple authentications:

```
A2 (rw) -> set multiauth mode multi
```

10.3.4.3 clear multiauth mode

Use this command to clear the system authentication mode.

clear multiauth mode

Syntax Description

None

Command Mode

Read-Write.

Command Defaults

None.

Example

This example shows how to clear the system authentication mode:

```
A2 (rw) ->clear multiauth mode
```

10.3.4.4 set multiauth precedence

Use this command to set the system's multiple authentication administrative precedence. When a user is successfully authenticated by more than one method at the same time, the precedence of the authentication methods will determine which RADIUS-returned attribute will be processed.

set multiauth precedence {[dot1x] [mac]}

Syntax Description

dot1x	Sets precedence for 802.1X authentication.
mac	Sets precedence for MAC authentication.

Command Mode

Read-Write.

Command Defaults

None.

Example

This example shows how to set precedence for MAC authentication:

```
A2 (rw) -> set multiauth precedence mac dot1x
```

10.3.4.5 clear multiauth precedence

Use this command to clear the system's multiple authentication administrative precedence.

clear multiauth precedence

Syntax Description

None

Command Mode

Read-Write.

Command Defaults

None.

Example

This example shows how to clear the multiple authentication precedence:

```
A2 (rw) ->clear multiauth precedence
```

10.3.4.6 show multiauth port

Use this command to display multiple authentication properties for one or more ports.

show multiauth port [*port-string*]

Syntax Description

<i>port-string</i>	(Optional) Displays multiple authentication information for specific port(s).
--------------------	---

Command Mode

Read-Only.

Command Defaults

If port-string is not specified, multiple authentication information will be displayed for all ports.

Example

This example shows how to display multiple authentication information for ports fe.1.1-5:

A2 (rw) -> show multiauth port fe.1.1-5				
Port	Mode	Max users	Allowed users	Current users
-----	-----	-----	-----	-----
fe.1.1	auth-opt	1	1	0
fe.1.2	auth-opt	1	1	0
fe.1.3	auth-opt	1	1	0
fe.1.4	auth-opt	1	1	0
fe.1.5	auth-opt	1	1	0

10.3.4.7 set multiauth port

Use this command to set multiple authentication properties for one or more ports.

```
set multiauth port mode {auth-opt | auth-reqd | force-auth | force-unauth} |
numusers numusers port-string
```

Syntax Description

mode auth-opt auth-reqd force-auth force-unauth	<p>Specifies the port(s)' multiple authentication mode as:</p> <ul style="list-style-type: none">• auth-opt — Authentication optional (“non-strict” behavior). If a user does not attempt to authenticate using 802.1x, or if 802.1x authentication fails, the port will allow traffic to be forwarded according to the defined default VLAN.• auth-reqd — Authentication is required.• force-auth — Authentication considered.• force-unauth — Authentication disabled.
numusers <i>numusers</i>	Specifies the number of users allowed authentication on port(s).
<i>port-string</i>	Specifies the port(s) on which to set multiple authentication properties.

Command Mode

Read-Write.

Command Defaults

None

Example

This example shows how to set the port multiple authentication mode to required on fe.3.14:

```
A2 (rw) ->set multiauth port mode auth-reqd fe.3.14
```

10.3.4.8 clear multiauth port

Use this command to clear multiple authentication properties for one or more ports.

clear multiauth port {**mode** | **numusers**} *port-string*

Syntax Description

mode	Clears the specified port's multiple authentication mode.
numusers	Clears the value set for the number of users allowed authentication on the specified port.
<i>port-string</i>	Specifies the port or ports on which to clear multiple authentication properties.

Command Mode

Read-Write.

Command Defaults

None

Examples

This example shows how to clear the port multiple authentication mode on port ge.3.14:

```
A2 (rw) ->clear multiauth port mode ge.3.14
```

This example shows how to clear the number of users on port ge.3.14:

```
A2 (rw) ->clear multiauth port mode ge.3.14
```

10.3.4.9 show multiauth station

Use this command to display multiple authentication station (end user) entries.

```
show multiauth station [mac address] [port port-string]
```

Syntax Description

mac address	(Optional) Displays multiple authentication station entries for specific MAC address(es).
port port-string	(Optional) Displays multiple authentication station entries for specific port(s).

Command Mode

Read-Only.

Command Defaults

If no options are specified, multiple authentication station entries will be displayed for all MAC addresses and ports.

Example

This example shows how to display multiple authentication station entries. In this case, two end users are shown:

```
Matrix(rw)->show multiauth station
Port           Address type  Address
-----
fe.1.20        dot1x         00-10-a4-9e-24-87
fe.2.16        dot1x         00-b0-d0-e5-0c-d0
```

10.3.5 Configuring VLAN Authorization (RFC 3580)

Purpose

Please see section 3-31 of RFC 3580 for details on configuring a RADIUS server to return the desired tunnel attributes. From RFC 3580, "... it may be desirable to allow a port to be placed into a particular Virtual LAN (VLAN), defined in [IEEE8021Q], based on the result of the authentication."

The RADIUS server typically indicates the desired VLAN by including tunnel attributes within the Access-Accept. However, the IEEE 802.1X Authenticator may also provide a hint as to the VLAN to be assigned to the Supplicant by including Tunnel attributes within the Access-Request.

For use in VLAN assignment, the following tunnel attributes are used:

- Tunnel-Type=VLAN (13)
- Tunnel-Medium-Type=802
- Tunnel-Private-Group-ID=VLANID

Commands

The commands used to configure RADIUS tunnel attributes are listed below and described in the associated sections as shown.

- set vlanauthorization ([Section 10.3.5.1](#))
- set vlanauthorization egress ([Section 10.3.5.2](#))
- clear vlanauthorization ([Section 10.3.5.3](#))
- show vlanauthorization ([Section 10.3.5.4](#))

10.3.5.1 set vlanauthorization

Use this command to enable or disable the use of the RADIUS VLAN tunnel attribute to put a port into a particular VLAN based on the result of authentication.

```
set vlanauthorization {enable | disable} [port-string]
```

Syntax Description

enable disable	Enables or disables VLAN authorization/tunnel attributes
port-string	(Optional) Specifies which ports to enable or disable the use of VLAN tunnel attributes/authorization. For a detailed description of possible <i>port-string</i> values, refer to Section 3.1.1 .

Command Mode

Read-Write.

Command Defaults

VLAN authentication is disabled by default.

Examples

This example shows how to enable VLAN authentication for all Fast Ethernet ports:

```
A2 (rw) -> set vlanauthorization enable fe.*.*
```

This example shows how to disable VLAN authentication for all Fast Ethernet ports on stack unit 3:

```
A2 (rw) -> set vlanauthorization disable fe.3.*
```

10.3.5.2 set vlanauthorization egress

Use this command to control the modification of the current VLAN egress list of 802.1x authenticated ports for the VLAN(s) returned in the RADIUS authorization filter id string.

set vlanauthorization egress {none | tagged | untagged} *port-string*

Syntax Description

none	No egress manipulation will be made.
tagged	The authenticating port will be added to the current tagged egress list for the VLAN-ID returned.
untagged	The authenticating port will be added to the current untagged egress list for the VLAN-ID returned (default).
<i>port-string</i>	The port or list of ports to which this command will apply. For a detailed description of possible <i>port-string</i> values, refer to Section 3.1.1 .

Command Mode

Read-Write.

Command Default

By default the administrative egress will be set to untagged.

Example

This example shows how to enable the insertion of the RADIUS assigned VLAN to an 802.1q tag for all outbound frames for ports 10 thru 15 on unit number 3.

```
set vlanauthorization egress tagged fe.3.10-15
```

10.3.5.3 clear vlanauthorization

Use this command to return port(s) to the default VLAN authorization configuration (disabled, egress untagged).

clear vlanauthorization [*port-string*]

Syntax Description

<i>port-string</i>	(Optional) Specifies which ports are to be restored to default configuration. If no port string is entered, the action will be a global setting. For a detailed description of possible <i>port-string</i> values, refer to Section 3.1.1 .
--------------------	---

Command Mode

Read-Write.

Command Defaults

If no port string is entered, all ports across the stack will be reset to the default configuration with VLAN authorization disabled and egress frames untagged.

Example

This example shows how to clear VLAN authentication for all ports on slots 3, 4, and 5:

```
clear vlanauthorization fe.3-5.*
```

10.3.5.4 show vlanauthorization

This command displays the VLAN authorization status and configuration information for the specified ports.

show vlanauthorization [*port-string*]

Syntax Description

<i>port-string</i>	(Optional) Displays VLAN authorization status for the specified ports. For a detailed description of possible <i>port-string</i> values, refer to Section 3.1.1 .
--------------------	---

Command Mode

Read-Only.

Command Defaults

If no port string is entered, the status for all ports will be displayed.

Example

This command shows how to display VLAN authorization status for Fast Ethernet port 1 on unit 1.

A2 (rw) -> show vlanauthorization fe.1.1				
port	status	administrative egress	operational egress	vlan id
----	-----	-----	-----	-----
fe.1.1	enabled	untagged	none	0

[Table 10-5](#) provides an explanation of command output. For details on using the **set vlanauthorization** command to enable and assign protocol and egress attributes, refer to sections [Section 10.3.5.1](#) and [Section 10.3.5.2](#).

Table 10-5 show vlanauthorization Output Details

Output	What It Displays...
port	Port identification
status	Port status as assigned by set vlanauthorization command
administrative egress	Port status as assigned by the set vlanauthorization egress command

Table 10-5 show vlanauthorization Output Details (Continued)

Output	What It Displays...
operational egress	If authentication has succeeded, displays the VLAN ID assigned for egress.
vlan id	If authentication has succeeded, displays the assigned VLAN ID for ingress.

10.3.6 Configuring MAC Locking

Purpose

To review, disable, enable and configure MAC locking. This feature locks a MAC address to one or more ports, preventing connection of unauthorized devices through the port(s). When source MAC addresses are received on specified ports, the switch discards all subsequent frames not containing the configured source addresses. The only frames forwarded on a “locked” port are those with the “locked” MAC address(es) for that port.

When properly configured, MAC locking is an excellent security tool as it prevents MAC spoofing on configured ports. Also if a MAC were to be secured by something like Dragon Dynamic Intrusion Detection, MAC locking would make it more difficult for a hacker to send packets into the network because the hacker would have to change their MAC address and move to another port. In the meantime the system Administrator would be receiving a maclock trap notification.

Commands

The commands needed to configure MAC locking are listed below and described in the associated section as shown:

- show maclock ([Section 10.3.6.1](#))
- show maclock stations ([Section 10.3.6.2](#))
- set maclock enable ([Section 10.3.6.3](#))
- set maclock disable ([Section 10.3.6.4](#))
- set maclock ([Section 10.3.6.5](#))
- clear maclock ([Section 10.3.6.6](#))
- set maclock static ([Section 10.3.6.7](#))
- clear maclock static ([Section 10.3.6.8](#))
- set maclock firstarrival ([Section 10.3.6.9](#))
- clear maclock firstarrival ([Section 10.3.6.10](#))
- set maclock move ([Section 10.3.6.11](#))
- set maclock trap ([Section 10.3.6.12](#))

10.3.6.1 show maclock

Use this command to display the status of MAC locking on one or more ports.

```
show maclock [port-string]
```

Syntax Description

<i>port-string</i>	(Optional) Displays MAC locking status for specified port(s). For a detailed description of possible <i>port-string</i> values, refer to Section 3.1.1 .
--------------------	--

Command Defaults

If *port-string* is not specified, MAC locking status will be displayed for all ports.

Command Mode

Read-Only.

Example

This example shows how to display MAC locking information for ports fe.3.1-5:

A2 (rw) -> **show maclock fe.3.1-5**
MAC locking is globally enabled

Port Number	Port Status	Trap Status	Max Static Allocated	Max FirstArrival Allocated	Violating MAC Address
-----	-----	-----	-----	-----	-----
fe.3.1	disabled	disabled	2	600	00:00:00:00:00:00
fe.3.2	enabled	disabled	20	600	00:00:00:00:00:00
fe.3.3	disabled	disabled	20	600	00:00:00:00:00:00
fe.3.4	disabled	disabled	20	600	00:00:00:00:00:00
fe.3.5	disabled	disabled	20	600	00:00:00:00:00:00

[Table 10-6](#) provides an explanation of the command output.

Table 10-6 show maclock Output Details

Output	What It Displays...
Port Number	Port designation. For a detailed description of possible <i>port-string</i> values, refer to Section 3.1.1 .
Port Status	Whether MAC locking is enabled or disabled on the port. MAC locking is globally disabled by default. For details on using set maclock to enable it on the device and on one or more ports, refer to Section 10.3.6.3 .
Trap Status	Whether MAC lock trap messaging is enabled or disabled on the port. For details on setting this status using the set maclock trap command, refer to Section 10.3.6.12 .
Max Static Allocated	The maximum number of static MAC addresses allowed to be locked to a port. For details on setting this value using the set maclock static command, refer to Section 10.3.6.7 .
Max FirstArrival Allocated	The maximum end station MAC addresses allowed locked to the port. For details on setting this value using the set maclock firstarrival command, refer to Section 10.3.6.9 .
Violating MAC Address	Most recent MAC address(es) violating the first arrival value set for the port.

10.3.6.2 show maclock stations

Use this command to display MAC locking information about end stations connected to the device.

```
show maclock stations [port-string]
```

Syntax Description

<i>port-string</i>	(Optional) Displays end station information for specified port(s). For a detailed description of possible <i>port-string</i> values, refer to Section 3.1.1 .
--------------------	---

Command Defaults

If *port-string* is not specified, MAC locking information will be displayed for all end stations.

Command Mode

Read-Only.

Example

This example shows how to display MAC locking information for the end stations connected to all Fast Ethernet ports in unit 3:

A2 (rw) -> show maclock stations fe.3.*			
Port Number	MAC Address	Status	State
-----	-----	-----	-----
fe.3.2	0e:03:ef:d8:0e:03	active	static
fe.3.2	00:00:1d:c3:61:f8	active	first arrival
fe.3.2	00:00:5e:00:01:01	active	first arrival
fe.3.2	00:01:f4:da:5a:53	active	first arrival

[Table 10-7](#) provides an explanation of the command output.

Table 10-7 show maclock stations Output Details

Output	What It Displays...
Port Number	Port designation. For a detailed description of possible <i>port-string</i> values, refer to Section 3.1.1 .
MAC Address	MAC address of the end station(s) locked to the port.
Status	Whether the end stations are active or inactive .
State	Whether the end station locked to the port is a first learned or first arrival connection.

10.3.6.3 set maclock enable

Use this command to enable MAC locking globally on the switch, and then on a port by port basis. Both must be done for MAC locking to function. When enabled and configured for a specific MAC address and port string, this locks a port so that only one end station address is allowed to communicate on the port.

set maclock enable [*port-string*]

Syntax Description

<i>port-string</i>	(Optional) Enables MAC locking on specific port(s). For a detailed description of possible <i>port-string</i> values, refer to Section 3.1.1 .
--------------------	--

Command Defaults

If *port-string* is not specified, then MAC locking is enabled globally on the switch.

Command Mode

Read-Write.

Examples

This example shows how to enable MAC locking on the switch:

```
A2 (rw) -> set maclock enable
```

This example shows how to enable MAC locking on fe.2.3:

```
A2 (rw) -> set maclock enable fe.2.3
```

10.3.6.4 set maclock disable

Use this command to disable MAC locking globally on the switch, or on one or more ports.

set maclock disable [*port-string*]

Syntax Description

<i>port-string</i>	(Optional) Disables MAC locking on specific port(s). For a detailed description of possible <i>port-string</i> values, refer to Section 3.1.1 .
--------------------	---

Command Defaults

If *port-string* is not specified, MAC locking will be disabled on the switch.

Command Mode

Read-Write.

Examples

This example shows how to disable MAC locking on the switch:

```
A2 (rw) -> set maclock disable
```

This example shows how to disable MAC locking on fe.2.3:

```
A2 (rw) -> set maclock disable fe.2.3
```

10.3.6.5 set maclock

Use this command to create a static MAC address and enable or disable MAC locking for the specified MAC address and port. When created and enabled, the specified MAC address is the only MAC that will be permitted to communicate on the port.

set maclock *mac_address* *port-string* {**create** | **enable** | **disable**}

NOTE: Configuring one or more ports for MAC locking requires globally enabling it on the device first using the **set maclock enable** command as described in [Section 10.3.6.3](#).

Syntax Description

<i>mac_address</i>	Specifies the MAC address for which MAC locking will be created, enabled or disabled.
<i>port-string</i>	Specifies the port on which to create, enable or disable MAC locking for the specified MAC. For a detailed description of possible <i>port-string</i> values, refer to Section 3.1.1 .
create	Establishes a MAC locking association between the specified MAC address and port. Create automatically enables MAC locking between the specified MAC address and port.
enable disable	Enables or disables MAC locking between the specified MAC address and port.

Command Defaults

None.

Command Mode

Read-Write.

Example

This example shows how to create a MAC locking association between MAC address 00-a0-c9-0d-32-11 and port fe.3.2:

```
A2 (rw) ->set maclock 0e:03:ef:d8:44:55 fe.3.2 create
```

10.3.6.6 clear maclock

Use this command to remove a static maclock MAC address entry. The MAC address that is cleared will no longer be able to communicate on the port unless the first arrival limit has been set to a value greater than 0 and this limit has not yet been met.

For example, if user B’s MAC is removed from the static MAC address list and the first arrival limit has been set to 0, then user B will not be able to communicate on the port. If user A’s MAC is removed from the static MAC address list and the first arrival limit has been set to 10, but only has 7 entries, user A will become the 8th entry and allowed to communicate on the port.

clear maclock *mac_address port-string*

Syntax Description

<i>mac_address</i>	Specifies the MAC address that will be removed from the list of static MACs allowed to communicate on the port.
<i>port-string</i>	Specifies the port on which to clear the MAC address. For a detailed description of possible <i>port-string</i> values, refer to Section 3.1.1 .

Command Defaults

None.

Command Mode

Read-Write.

Example

This example shows how to remove a MAC from the list of static MACs allowed to communicate on port fe.3.2:

```
A2 (rw) ->clear maclock 0e:03:ef:d8:44:55 fe.3.2
```

10.3.6.7 set maclock static

Use this command to set the maximum number of static MAC addresses allowed per port. Static MACs are administratively defined.

set maclock static *port-string value*

Syntax Description

<i>port-string</i>	Specifies the port on which to set the maximum number of static MACs allowed. For a detailed description of possible <i>port-string</i> values, refer to Section 3.1.1 .
<i>value</i>	Specifies the maximum number of static MAC addresses allowed per port. Valid values are 0 to 20.

Command Defaults

None.

Command Mode

Read-Write.

Example

This example shows how to set the maximum number of allowable static MACs to 2 on fe.3.1:

A2 (rw) ->set maclock static fe.3.1 2

10.3.6.8 clear maclock static

Use this command to reset the number of static MAC addresses allowed per port to the default value of 20.

clear maclock static *port-string*

Syntax Description

<i>port-string</i>	Specifies the port on which to reset number of static MAC addresses allowed. For a detailed description of possible <i>port-string</i> values, refer to Section 3.1.1 .
--------------------	---

Command Defaults

None.

Command Mode

Read-Write.

Example

This example shows how to reset the number of allowable static MACs on fe.2.3:

```
A2 (rw) ->clear maclock static fe.2.3
```

10.3.6.9 set maclock firstarrival

Use this command to restrict MAC locking on a port to a maximum number of end station addresses first connected to that port. The maclock first arrival count resets when the link goes down. This feature is beneficial if you have roaming users—the first arrival count will be reset every time a user moves to another port, but will still protect against connecting multiple devices on a single port and will protect against MAC address spoofing.

If you wish to have only statically set MACs use a port, set the first arrival limit to 0.

set maclock firstarrival *port-string* *value*

Syntax Description

<i>port-string</i>	Specifies the port on which to limit MAC locking. For a detailed description of possible <i>port-string</i> values, refer to Section 3.1.1 .
<i>value</i>	Specifies the number of first arrival end station MAC addresses to be allowed connections to the port. Valid values are 0 to 600 .

Command Defaults

None.

Command Mode

Read-Write.

Example

This example shows how to restrict MAC locking to 6 MAC addresses on fe.2.3:

```
A2 (rw) ->set maclock firstarrival fe.2.3 6
```

10.3.6.10 clear maclock firstarrival

Use this command to reset the number of first arrival MAC addresses allowed per port to the default value of 600.

clear maclock firstarrival *port-string*

Syntax Description

<i>port-string</i>	Specifies the port on which to reset the first arrival value. For a detailed description of possible <i>port-string</i> values, refer to Section 3.1.1 .
--------------------	--

Command Defaults

None.

Command Mode

Read-Write.

Example

This example shows how to reset MAC first arrivals on fe.2.3:

```
A2 (rw) ->clear maclock firstarrival fe.2.3
```

10.3.6.11 set maclock move

Use this command to move all current first arrival MACs to static entries. If there are more firstarrival MACs than the allowed maximum static MACs, then only the latest firstarrival MACS will be used. For example, if the **set maclock static** command was used to set the maximum number of static MACs to 2, then the **set maclock move** command was used, but there were 5 MACs in the first arrival table, only the 2 most recent MAC entries would be used.

set maclock move *port-string*

Syntax Description

<i>port-string</i>	Specifies the port on which MAC will be move from first arrival MACs to static entries. For a detailed description of possible <i>port-string</i> values, refer to Section 3.1.1 .
--------------------	--

Command Defaults

None.

Command Mode

Read-Write.

Example

This example shows how to move all current first arrival MACs to static entries on ports fe.3.1-40:

A2 (rw) ->**set maclock move fe.3.1-40**

10.3.6.12 set maclock trap

Use this command to enable or disable MAC lock trap messaging. When enabled, this feature authorizes the switch to send an SNMP trap message if an end station is connected that exceeds the maximum value configured using the **set maclock firstarrival** command. Violating MAC addresses are dropped from the switch’s routing table.

set maclock trap *port-string* {enable | disable}

Syntax Description

<i>port-string</i>	Specifies the port on which MAC lock trap messaging will be enabled or disabled. For a detailed description of possible <i>port-string</i> values, refer to Section 3.1.1 .
enable disable	Enables or disables MAC lock trap messaging.

Command Defaults

None.

Command Mode

Read-Write.

Example

This example shows how to enable MAC lock trap messaging on fe.2.3:

```
A2 (rw) ->set maclock trap fe.2.3 enable
```

10.3.7 Configuring Secure Shell (SSH)

Purpose

To review, enable, disable, and configure the Secure Shell (SSH) protocol, which provides secure Telnet.

Commands

The commands used to review and configure SSH are listed below and described in the associated section as shown:

- show ssh status ([Section 10.3.7.1](#))
- set ssh ([Section 10.3.7.2](#))
- set ssh hostkey ([Section 10.3.7.3](#))

10.3.7.1 **show ssh status**

Use this command to display the current status of SSH on the switch.

show ssh status

Syntax Description

None.

Command Mode

Read-Only.

Command Defaults

None.

Example

This example shows how to display SSH status on the switch:

```
A2 (rw) -> show ssh status  
SSH Server status: Disabled.
```

10.3.7.2 set ssh

Use this command to enable, disable or reinitialize SSH server on the device.

set ssh {enable | disable | reinitialize}

Syntax Description

enable disable	Enables or disables SSH, or reinitializes the SSH server.
reinitialize	Reinitializes the SSH server.

Command Mode

Read-Write.

Command Defaults

None.

Example

This example shows how to disable SSH:

```
A2 (rw) -> set ssh disable
```

10.3.7.3 set ssh hostkey

Use this command to set or reinitialize new SSH authentication keys.

set ssh hostkey [reinitialize]

Syntax Description

reinitialize	(Optional) Reinitializes the server host authentication keys.
---------------------	---

Command Mode

Read-Write.

Command Defaults

If **reinitialize** is not specified, the user must supply SSH authentication key values.

Example

This example shows how to regenerate SSH keys:

```
A2 (rw) -> set ssh hostkey reinitialize
```

Logging and Network Management

This chapter describes switch-related logging and network management commands and how to use them.

11.1 PROCESS OVERVIEW: NETWORK MANAGEMENT

Switch-related network management tasks include the following:

- Configuring System Logging ([Section 11.2.1](#))
- Monitoring Network Events and Status ([Section 11.2.2](#))
- Managing Network Addresses and Routes ([Section 11.2.3](#))
- Configuring SNTP ([Section 11.2.4](#))
- Configuring Node Aliases ([Section 11.2.5](#))

11.2 LOGGING AND NETWORK MANAGEMENT COMMAND SET

11.2.1 Configuring System Logging

Purpose

To display and configure system logging, including Syslog server settings, logging severity levels for various applications, Syslog default settings, and the logging buffer.

Commands

Commands to configure system logging are listed below and described in the associated section as shown.

- show logging server ([Section 11.2.1.1](#))
- set logging server ([Section 11.2.1.2](#))
- clear logging server ([Section 11.2.1.3](#))
- show logging default ([Section 11.2.1.4](#))
- set logging default ([Section 11.2.1.5](#))
- clear logging default ([Section 11.2.1.6](#))
- show logging local ([Section 11.2.1.7](#))
- set logging local ([Section 11.2.1.8](#))
- clear logging local ([Section 11.2.1.9](#))
- show logging buffer ([Section 11.2.1.10](#))

11.2.1.1 show logging server

Use this command to display the Syslog configuration for a particular server.

show logging server [*index*]

Syntax Description

<i>index</i>	(Optional) Displays Syslog information pertaining to a specific server table entry. Valid values are 1-8 .
--------------	---

Command Defaults

If *index* is not specified, all Syslog server information will be displayed.

Command Type

Switch command.

Command Mode

Read-Only.

Example

This example shows how to display Syslog server configuration information.

```
A2 (rw) ->show logging server
```

IP Address	Facility	Severity	Description	Port	Status

1 132.140.82.111	local4	warning(5)	default	514	enabled
2 132.140.90.84	local4	warning(5)	default	514	enabled

11.2.1.2 set logging server

Use this command to configure a Syslog server.

```
set logging server index [ip-addr ip-addr] [facility facility] [severity severity]
[descr descr] [port port] [state {enable | disable}]
```

Syntax Description

<i>index</i>	Specifies the server table index number for this server. Valid values are 1 - 8 .
ip-addr <i>ip-addr</i>	(Optional) Specifies the Syslog message server's IP address.
facility <i>facility</i>	(Optional) Specifies the server's facility name. Valid values are: local0 to local7 .
severity <i>severity</i>	(Optional) Specifies the severity level at which the server will log messages. Valid <i>severity</i> values range from 1 to 8. The corresponding levels are: <ul style="list-style-type: none">• emergencies (system is unusable) – 1• alerts (immediate action required) – 2• critical conditions – 3• error conditions – 4• warning conditions – 5• notifications (significant conditions) – 6• informational messages – 7• debugging messages – 8
descr <i>descr</i>	(Optional) Specifies a textual string description of this facility/server.
port <i>port</i>	(Optional) Specifies the default UDP port the client uses to send to the server.
state enable disable	(Optional) Enables or disables this facility/server configuration.

Command Defaults

- If **ip-addr** is not specified, an entry in the Syslog server table will be created with the specified *index* number and the system loopback address, 127.0.0.1, will be used.
- If not specified, **facility**, severity and port will be set to defaults configured with the **set logging default** command ([Section 11.2.1.5](#)).
- If **state** is not specified, the server will not be enabled or disabled.

Command Type

Switch command.

Command Mode

Read-Write.

Example

This command shows how to enable a Syslog server configuration for index 1, IP address 134.141.89.113, facility local4, severity level 3 on port 514:

```
A2 (rw) -> set logging server 1 ip-addr 134.141.89.113 facility local4 severity 3  
port 514 state enable
```

11.2.1.3 clear logging server

Use this command to remove a server from the Syslog server table.

clear logging server *index*

Syntax Description

<i>index</i>	Specifies the server table index number for the server to be removed. Valid values are 1 - 8 .
--------------	---

Command Defaults

None.

Command Type

Switch command.

Command Mode

Read-Write.

Example

This command shows how to remove the Syslog server with index 1 from the server table:

A2 (rw) ->**clear logging server 1**

11.2.1.4 show logging default

Use this command to display the Syslog server default values.

show logging default

Syntax Description

None.

Command Defaults

None.

Command Type

Switch command.

Command Mode

Read-Only.

Example

This command shows how to display the Syslog server default values.

```
A2 (rw) ->show logging default
```

	Facility	Severity	Port
Defaults:	local4	warning(5)	514

11.2.1.5 set logging default

Use this command to set logging default values.

```
set logging default {[facility facility] [severity severity] port port}}
```

Syntax Description

facility <i>facility</i>	Specifies the default facility name. Valid values are: local0 to local7 .
severity <i>severity</i>	Specifies the default logging severity level. Valid <i>severity</i> values range from 1 to 8. The corresponding levels are: <ul style="list-style-type: none">emergencies (system is unusable) – 1alerts (immediate action required) – 2critical conditions – 3error conditions – 4warning conditions – 5notifications (significant conditions) – 6informational messages – 7debugging messages – 8
port <i>port</i>	Specifies the default UDP port the client uses to send to the server.

Command Defaults

None.

Command Type

Switch command.

Command Mode

Read-Write.

Example

This example shows how to set the Syslog default facility name to local2 and the severity level to 4 (error logging):

A2 (rw) ->**set logging default facility local2 severity 4**

11.2.1.6 clear logging default

Use this command to reset logging default values.

clear logging default {[**facility**] [**severity**] [**port**]}

Syntax Description

facility	(Optional) Resets the default facility name to local4 .
severity	(Optional) Resets the default logging severity level to 6 (notifications of significant conditions).
port	(Optional) Resets the default UDP port the client uses to send to the server to 514 .

Command Defaults

- At least one optional parameter must be entered.
- All three optional keywords must be entered to reset all logging values to defaults.

Command Type

Switch command.

Command Mode

Read-Write.

Example

This example shows how to reset the Syslog default severity level to 6:

```
A2 (rw) ->clear logging default severity
```

11.2.1.7 **show logging local**

Use this command to display the state of message logging to the console and a persistent file.

show logging local

Syntax Description

None.

Command Defaults

None.

Command Type

Switch command.

Command Mode

Read-Only.

Example

This example shows how to display the state of message logging. In this case, logging to the console is enabled and logging to a persistent file is disabled.

```
A2 (rw) -> show logging local  
Syslog Console Logging enabled  
Syslog File Logging disabled
```

11.2.1.8 set logging local

Use this command to configure log messages to the console and a persistent file.

set logging local console {enable | disable} file {enable | disable}

Syntax Description

console enable disable	Enables or disables logging to the console.
file enable disable	Enables or disables logging to a persistent file.

Command Defaults

None.

Command Type

Switch command.

Command Mode

Read-Write.

Example

This command shows how to enable logging to the console and disable logging to a persistent file:

```
A2 (rw) -> set logging local console enable file disable
```

11.2.1.9 clear logging local

Use this command to clear the console and persistent store logging for the local session.

clear logging local

Syntax Description

None.

Command Defaults

None.

Command Type

Switch command.

Command Mode

Read-Write.

Example

This example shows how to clear local logging:

```
A2 (rw) ->clear logging local
```

11.2.1.10 show logging buffer

Use this command to display the last 256 messages logged.

show logging buffer

Syntax Description

None.

Command Defaults

None.

Command Type

Switch command.

Command Mode

Read-Only.

Example

This example shows a portion of the information displayed with the **show logging buffer** command:

```
A2 (rw) -> show logging buffer
<165>Sep  4 07:43:09 10.42.71.13 CLI[5]User:rw logged in from 10.2.1.122
(telnet)
<165>Sep  4 07:43:24 10.42.71.13 CLI[5]User: debug failed login from 10.4.1.100
(telnet)
```

11.2.2 Monitoring Network Events and Status

Purpose

To display switch events and command history, to set the size of the history buffer, and to display and disconnect current user sessions.

Commands

Commands to monitor switch network events and status are listed below and described in the associated section as shown.

- history ([Section 11.2.2.1](#))
- show history ([Section 11.2.2.2](#))
- set history ([Section 11.2.2.3](#))
- ping ([Section 11.2.2.4](#))
- show users ([Section 11.2.2.5](#))
- disconnect ([Section 11.2.2.6](#))

11.2.2.1 history

Use this command to display the contents of the command history buffer. The command history buffer includes all the switch commands entered up to a maximum of 100, as specified in the **set history** command ([Section 11.2.2.3](#)).

history

Syntax Description

None.

Command Defaults

None.

Command Mode

Read-Only.

Example

This example shows how to display the contents of the command history buffer. It shows there are five commands in the buffer:

```
A2 (rw) ->history
 1 hist
 2 show gvrp
 3 show vlan
 4 show igmp
 5 show ip address
```

11.2.2.2 **show history**

Use this command to display the size (in lines) of the history buffer.

show history

Syntax Description

None.

Command Defaults

None.

Command Mode

Read-Only.

Example

This example shows how to display the size of the history buffer:

```
A2 (rw) -> show history  
History buffer size: 20
```

11.2.2.3 set history

Use this command to set the size of the history buffer.

set history *size* [**default**]

Syntax Description

<i>size</i>	Specifies the size of the history buffer in lines. Valid values are 1 to 100 .
default	(Optional) Makes this setting persistent for all future sessions.

Command Defaults

None.

Command Mode

Read-Write.

Example

This example shows how to set the size of the command history buffer to 30 lines:

```
A2 (rw) -> set history 30
```

11.2.2.4 ping

Use this command to send ICMP echo-request packets to another node on the network from the switch CLI.

ping *host*

Syntax Description

<i>host</i>	Specifies the IP address of the device to which the ping will be sent.
-------------	---

Command Defaults

None.

Command Mode

Read-Write.

Examples

This example shows how to ping IP address 134.141.89.29. In this case, this host is alive:

```
A2 (rw)->ping 134.141.89.29  
134.141.89.29 is alive
```

In this example, the host at IP address is not responding:

```
A2 (rw)->ping 134.141.89.255  
no answer from 134.141.89.255
```

This example shows how to ping IP address 134.141.89.29 with 10 packets:

```
A2 (rw)->ping 134.141.89.29 10  
PING 134.141.89.29: 56 data bytes  
64 bytes from 134.141.89.29: icmp-seq=0. time=0. ms  
64 bytes from 134.141.89.29: icmp-seq=1. time=0. ms  
64 bytes from 134.141.89.29: icmp-seq=2. time=0. ms  
64 bytes from 134.141.89.29: icmp-seq=3. time=0. ms  
64 bytes from 134.141.89.29: icmp-seq=4. time=0. ms  
64 bytes from 134.141.89.29: icmp-seq=5. time=0. ms  
64 bytes from 134.141.89.29: icmp-seq=6. time=0. ms  
64 bytes from 134.141.89.29: icmp-seq=7. time=0. ms  
64 bytes from 134.141.89.29: icmp-seq=8. time=0. ms  
64 bytes from 134.141.89.29: icmp-seq=9. time=0. ms ----134.141.89.29 PING Sta-  
tistics---- 10 packets transmitted, 10 packets received, 0% packet loss  
round-trip (ms) min/avg/max = 0/0/0
```

11.2.2.5 show users

Use this command to display information about the active console port or Telnet session(s) logged in to the switch.

show users

Syntax Description

None.

Command Defaults

None.

Command Mode

Read-Only.

Example

This example shows how to use the **show users** command. In this output, there are two Telnet users logged in with Read-Write access privileges from IP addresses 134.141.192.119 and 134.141.192.18:

```
A2 (rw) -> show users
  Session  User  Location
  -----
* telnet   rw    134.141.192.119
telnet     rw    134.141.192.18
```

11.2.2.6 disconnect

Use this command to close an active console port or Telnet session from the switch CLI.

disconnect {*ip-addr* | **console**}

Syntax Description

<i>ip-addr</i>	Specifies the IP address of the Telnet session to be disconnected. This address is displayed in the output shown in Section 11.2.2.5 .
console	Closes an active console port.

Command Defaults

None.

Command Mode

Read-Write.

Examples

This example shows how to close a Telnet session to host 134.141.192.119:

```
A2 (rw) ->disconnect 134.141.192.119
```

This example shows how to close the current console session:

```
A2 (rw) ->disconnect console
```

11.2.3 Managing Switch Network Addresses and Routes

Purpose

To display or delete switch ARP table entries, and to display MAC address information.

Commands

Commands to manage switch network addresses and routes are listed below and described in the associated section as shown.

- show arp ([Section 11.2.3.1](#))
- clear arp ([Section 11.2.3.2](#))
- show mac ([Section 11.2.3.3](#))
- show mac agetime ([Section 11.2.3.4](#))

11.2.3.1 show arp

Use this command to display the switch’s ARP table.

show arp

Syntax Description

None.

Command Defaults

None.

Command Mode

Read-Only.

Example

This example shows how to display the ARP table:

A2 (rw) -> show arp			
LINK LEVEL ARP TABLE			
IP Address	Phys Address	Flags	Interface

10.20.1.1	00-00-5e-00-01-1	S	host
134.142.21.194	00-00-5e-00-01-1	S	host
134.142.191.192	00-00-5e-00-01-1	S	host
134.142.192.18	00-00-5e-00-01-1	S	host
134.142.192.119	00-00-5e-00-01-1	S	host

Table 11-1 provides an explanation of the command output.

Table 11-1 show arp Output Details

Output	What It Displays...
IP Address	IP address mapped to MAC address.
Phys Address	MAC address mapped to IP address.
Flags	Route status. Possible values and their definitions include: S - manually configured entry (static) P - respond to ARP requests for this entry

11.2.3.2 clear arp

Use this command to delete a specific entry or all entries from the switch's ARP table.

clear arp {*ip* | **all**}

Syntax Description

<i>ip</i> all	Specifies the IP address in the ARP table to be cleared, or clears all ARP entries.
------------------------	---

Command Defaults

None.

Command Mode

Read-Write.

Example

This example shows how to delete entry 10.1.10.10 from the ARP table:

```
A2 (rw) ->clear arp 10.1.10.10
```

11.2.3.3 show mac

Use this command to display MAC addresses in the switch’s filtering database. These are addresses learned on a port through the switching process.

```
show mac [address mac-address] [fid fid] [port port-string] [type {other |
invalid | learned | self | mgmt}]
```

Syntax Description

address <i>mac-address</i>	(Optional) Displays a specific MAC address (if it is known by the device).
fid <i>fid</i>	(Optional) Displays MAC addresses for a specific filter database identifier.
port <i>port-string</i>	(Optional) Displays MAC addresses for specific port(s). For a detailed description of possible <i>port-string</i> values, refer to Section 3.1.1 .
type other invalid learned self mgmt	(Optional) Displays information related to other , invalid , learned , self or mgmt (management) address type.

Command Defaults

If no parameters are specified, all MAC addresses for the device will be displayed.

Command Mode

Read-Only.

Example

This example shows how to display MAC address information for fe.2.4:

```
A2 (rw) -> show mac port fe.2.4
```

MAC Address	FID	Port	Type
-----	-----	-----	-----
00-00-39-EB-F8-35	1	fe.2.4	learned
00-00-5E-00-01-01	1	fe.2.4	learned
00-00-F6-00-86-71	1	fe.2.4	learned
00-00-F8-07-1C-EE	1	fe.2.4	learned
00-00-F8-07-41-68	1	fe.2.4	learned
00-00-F8-78-D3-55	1	fe.2.4	learned

00-A0-C9-73-9D-16	1	fe.2.4	learned

Table 11-2 provides an explanation of the command output.

Table 11-2 show mac Output Details

Output	What It Displays...
MAC Address	MAC addresses mapped to the port(s) shown.
FID	Filter database identifier.
Port	Port designation.
Type	Address type. Valid types are: <ul style="list-style-type: none"> • learned • self • mgmt • other

11.2.3.4 **show mac agetime**

Use this command to display the timeout period for aging learned MAC entries.

show mac agetime

Syntax Description

None.

Command Defaults

None.

Command Mode

Read-Only.

Example

This example shows how to display the MAC timeout period:

```
A2 (rw) -> show mac agetime  
Aging time: 300 seconds
```

11.2.4 Configuring Simple Network Time Protocol (SNTP)

Purpose

To configure the Simple Network Time Protocol (SNTP), which synchronizes device clocks in a network.

Commands

Commands to configure SNTP are listed below and described in the associated section as shown.

- show sntp ([Section 11.2.4.1](#))
- set sntp client ([Section 11.2.4.2](#))
- clear sntp client ([Section 11.2.4.3](#))
- set sntp server ([Section 11.2.4.4](#))
- clear sntp server ([Section 11.2.4.5](#))
- set sntp poll-interval ([Section 11.2.4.6](#))
- clear sntp poll-interval ([Section 11.2.4.7](#))
- set sntp poll-retry ([Section 11.2.4.8](#))
- clear sntp poll-retry ([Section 11.2.4.9](#))
- set sntp poll-timeout ([Section 11.2.4.10](#))
- clear sntp poll-timeout ([Section 11.2.4.11](#))

11.2.4.1 show sntp

Use this command to display SNTP client settings.

show sntp

Syntax Description

None.

Command Defaults

None.

Command Mode

Read-Only.

Example

This example shows how to display SNTP client settings:

```
A2(rw)->show sntp
SNTP Version: 3
Current Time: TUE SEP 09 16:13:33 2003
Timezone: 'EST', offset from UTC is -4 hours and 0 minutes
Client Mode: unicast
Broadcast Count: 0
Poll Interval: 512 seconds
Poll Retry: 1
Poll Timeout: 5 seconds
SNTP Poll Requests: 1175
Last SNTP Update: TUE SEP 09 16:05:24 2003
Last SNTP Request: TUE SEP 09 16:05:24 2003
Last SNTP Status: Success

SNTP-Server      Precedence      Status
-----
10.2.8.6         2               Active
144.111.29.19   1               Active
```

[Table 11-3](#) provides an explanation of the command output.

Table 11-3 show sntp Output Details

Output	What It Displays...
SNTP Version	SNTP version number.
Current Time	Current time on the system clock.
Timezone	Time zone name and amount it is offset from UTC (Universal Time).
Client Mode	Whether SNTP client is operating in unicast or broadcast mode. Set using set sntp client command (Section 11.2.4.2).
Broadcast Count	Number of SNTP broadcast frames received.
Poll Interval	Interval between SNTP unicast requests. Default of 512 seconds can be reset using the set sntp poll-interval command (Section 11.2.4.6).
Poll Retry	Number of poll retries to a unicast SNTP server. Default of 1 can be reset using the set sntp poll-retry command (Section 11.2.4.8).
Poll Timeout	Timeout for a response to a unicast SNTP request. Default of 5 seconds can be reset using set sntp poll-timeout command (Section 11.2.4.11).
SNTP Poll Requests	Total number of SNTP poll requests.
Last SNTP Update	Date and time of most recent SNTP update.
Last SNTP Request	Date and time of most recent SNTP request.
Last SNTP Status	Whether or not broadcast reception or unicast transmission and reception was successful.
SNTP-Server	IP address(es) of SNTP server(s).
Precedence	Precedence level of SNTP server in relation to its peers. Highest precedence is 1 and lowest is 10. Default of 1 can be reset using the set sntp server command (Section 11.2.4.4).
Status	Whether or not the SNTP server is active.

11.2.4.2 set sntp client

Use this command to set the SNTP operation mode.

```
set sntp client {broadcast | unicast | disable}
```

Syntax Description

broadcast	Enables SNTP in broadcast client mode.
unicast	Enables SNTP in unicast (point-to-point) client mode. In this mode, the client must supply the IP address from which to retrieve the current time.
disable	Disables SNTP.

Command Defaults

None.

Command Mode

Read-Write.

Example

This example shows how to enable SNTP in broadcast mode:

```
A2 (rw) ->set sntp client broadcast
```

11.2.4.3 **clear sntp client**

Use this command to clear the SNTP client's operational mode.

clear sntp client

Syntax Description

None.

Command Defaults

None.

Command Mode

Read-Write.

Example

This example shows how to clear the SNTP client's operational mode:

```
A2 (rw) ->clear sntp client
```

11.2.4.4 set sntp server

Use this command to add a server from which the SNTP client will retrieve the current time when operating in unicast mode. Up to 10 servers can be set as SNTP servers.

set sntp server *ip-address* [*precedence*]

Syntax Description

<i>ip-address</i>	Specifies the SNTP server’s IP address.
<i>precedence</i>	(Optional) Specifies this SNTP server’s precedence in relation to its peers. Valid values are 1 (highest) to 10 (lowest).

Command Defaults

If *precedence* is not specified, 1 will be applied.

Command Mode

Read-Write.

Example

This example shows how to set the server at IP address 10.21.1.100 as an SNTP server:

A2 (rw) ->**set sntp server 10.21.1.100**

11.2.4.5 clear sntp server

Use this command to remove one or all servers from the SNTP server list.

clear sntp server {*ip-address* | **all**}

Syntax Description

<i>ip-address</i>	Specifies the IP address of a server to remove from the SNTP server list.
all	Removes all servers from the SNTP server list.

Command Defaults

None.

Command Mode

Read-Write.

Example

This example shows how to remove the server at IP address 10.21.1.100 from the SNTP server list:

```
A2 (rw) ->clear sntp server 10.21.1.100
```

11.2.4.6 set sntp poll-interval

Use this command to set the poll interval between SNTP unicast requests.

set sntp poll-interval *interval*

Syntax Description

<i>interval</i>	Specifies the poll interval in seconds. Valid values are 16 to 16284 .
-----------------	--

Command Defaults

None.

Command Mode

Read-Write.

Example

This example shows how to set the SNTP poll interval to 30 seconds:

```
A2 (rw) -> set sntp poll-interval 30
```

11.2.4.7 clear sntp poll-interval

Use this command to clear the poll interval between unicast SNTP requests.

clear sntp poll-interval

Syntax Description

None.

Command Defaults

None.

Command Mode

Read-Write.

Example

This example shows how to clear the SNTP poll interval:

```
A2 (rw) ->clear sntp poll-interval
```

11.2.4.8 **set sntp poll-retry**

Use this command to set the number of poll retries to a unicast SNTP server.

set sntp poll-retry *retry*

Syntax Description

<i>retry</i>	Specifies the number of retries. Valid values are 0 to 10 .
--------------	---

Command Defaults

None.

Command Mode

Read-Write.

Example

This example shows how to set the number of SNTP poll retries to 5:

A2 (rw) ->**set sntp poll-retry 5**

11.2.4.9 clear sntp poll-retry

Use this command to clear the number of poll retries to a unicast SNTP server.

clear sntp poll-retry

Syntax Description

None.

Command Defaults

None.

Command Mode

Read-Write.

Example

This example shows how to clear the number of SNTP poll retries:

```
A2 (rw) ->clear sntp poll-retry
```

11.2.4.10 set sntp poll-timeout

Use this command to set the poll timeout (in seconds) for a response to a unicast SNTP request.

set sntp poll-timeout *timeout*

Syntax Description

<i>timeout</i>	Specifies the poll timeout in seconds. Valid values are 1 to 30 .
----------------	---

Command Defaults

None.

Command Mode

Read-Write.

Example

This example shows how to set the SNTP poll timeout to 10 seconds:

```
A2 (rw) -> set sntp poll-timeout 10
```

11.2.4.11 clear sntp poll-timeout

Use this command to clear the SNTP poll timeout.

clear sntp poll-timeout

Syntax Description

None.

Command Defaults

None.

Command Mode

Read-Write.

Example

This example shows how to clear the SNTP poll timeout:

```
A2 (rw) ->clear sntp poll-timeout
```

11.2.5 Configuring Node Aliases

Purpose

To review, configure, disable, and re-enable node (port) alias functionality, which determines what network protocols are running on one or more ports.

Commands

Commands to configure node aliases are listed below and described in the associated section as shown.

- show nodealias config ([Section 11.2.5.1](#))
- set nodealias ([Section 11.2.5.2](#))
- clear nodealias config ([Section 11.2.5.3](#))

11.2.5.1 show nodealias config

Use this command to display node alias properties for one or more ports.

show nodealias config [*port-string*]

Syntax Description

<i>port-string</i>	(Optional) Displays node alias properties for specific port(s). For a detailed description of possible <i>port-string</i> values, refer to Section 3.1.1 .
--------------------	--

Command Defaults

If *port-string* is not specified, node alias properties will be displayed for all ports.

Command Mode

Read-Only.

Example

This example shows how to display node alias properties for fe.1.10:

```
A2 (rw) -> show nodealias config fe.1.10
```

Port Number	Max Entries	Used Entries	Status
-----	-----	-----	-----
fe.1.10	32	0	Enable

11.2.5.2 set nodealias

Use this command to enable or disable a node alias agent on one or more ports, or set the maximum number of alias entries per port. Upon packet reception, node aliases are dynamically assigned to ports enabled with an alias agent, which is the default setting on SecureStack A2 devices. Node aliases cannot be statically created, but can be deleted using the **clear node alias config** command as described in [Section 11.2.5.3](#).

set nodealias {enable | disable | maxentries} *port-string*

Syntax Description

enable disable	Enables or disables a node alias agent.
maxentries	Set the maximum number of alias entries per ports
<i>port-string</i>	Specifies the port(s) on which to enable/disable node alias agent or set a maximum number of entries. For a detailed description of possible <i>port-string</i> values, refer to Section 3.1.1 .

Command Defaults

None.

Command Type

Switch command.

Command Mode

Read-Write.

Example

This example shows how to disable the node alias agent on fe.1.3:

A2 (rw) ->**set nodealias disable fe.1.3**

11.2.5.3 clear nodealias config

Use this command to reset node alias state to enabled.

clear nodealias config *port-string*

Syntax Description

<i>port-string</i>	Specifies the port(s) on which to reset the node alias configuration. For a detailed description of possible <i>port-string</i> values, refer to Section 3.1.1 .
--------------------	--

Command Defaults

None.

Command Type

Switch command.

Command Mode

Read-Write.

Example

This example shows how to reset the node alias configuration on fe.1.3:

```
A2 (rw) ->clear nodealias config fe.1.3
```

Configuring RMON

RMON (Remote Network Monitoring) provides comprehensive network fault diagnosis, planning, and performance tuning information, and allows for interoperability between SNMP management stations and monitoring agents. RMON extends the SNMP MIB capability by defining additional MIBs that generate a much richer set of data about network usage. These MIB “groups” each gather specific sets of data to meet common network monitoring requirements.

12.1 RMON MONITORING GROUP FUNCTIONS

[Table 12-1](#) lists the RMON monitoring groups supported on SecureStack A2 devices, each group’s function and the elements it monitors, and the associated configuration commands needed.

Table 12-1 RMON Monitoring Group Functions and Commands

RMON Group	What It Does...	What It Monitors...	CLI Command(s)
Statistics	Records statistics measured by the RMON probe for each monitored interface on the device.	Packets dropped, packets sent, bytes sent (octets), broadcast and multicast packets, CRC errors, oversized and undersized packets, fragments, jabbers, and counters for packets.	show rmon stats (Section 12.2.1.1) set rmon stats (Section 12.2.1.2) clear rmon stats (Section 12.2.1.3)
History	Records periodic statistical samples from a network.	Sample period, number of samples and item(s) sampled.	show rmon history (Section 12.2.2.1) set rmon history (Section 12.2.2.2) clear rmon history (Section 12.2.2.3)

Table 12-1 RMON Monitoring Group Functions and Commands (Continued)

RMON Group	What It Does...	What It Monitors...	CLI Command(s)
Alarm	Periodically gathers statistical samples from variables in the probe and compares them with previously configured thresholds. If the monitored variable crosses a threshold, an event is generated.	Alarm type, interval, starting threshold, stop threshold.	show rmon alarm (Section 12.2.3.1) set rmon alarm properties (Section 12.2.3.2) set rmon alarm status (Section 12.2.3.3) clear rmon alarm (Section 12.2.3.4)
Event	Controls the generation and notification of events from the device.	Event type, description, last time event was sent.	show rmon event (Section 12.2.4.1) set rmon event properties (Section 12.2.4.2) set rmon event status (Section 12.2.4.3) clear rmon event (Section 12.2.4.4)
Filter	Allows packets to be matched by a filter equation. These matched packets form a data stream or “channel” that may be captured.	Packets matching the filter configuration.	show rmon channel (Section 12.2.5.1) set rmon channel (Section 12.2.5.2) clear rmon channel (Section 12.2.5.3) show rmon filter (Section 12.2.5.4) set rmon filter (Section 12.2.5.5) clear rmon filter (Section 12.2.5.6)
Packet Capture	Allows packets to be captured upon a filter match.	Packets matching the filter configuration.	show rmon capture (Section 12.2.6.1) set rmon capture (Section 12.2.6.2) clear rmon capture (Section 12.2.6.3)

12.2 RMON COMMAND SET

12.2.1 Statistics Group Commands

Purpose

To display, configure, and clear RMON statistics.

Commands

- show rmon stats ([Section 12.2.1.1](#))
- set rmon stats ([Section 12.2.1.2](#))
- clear rmon stats ([Section 12.2.1.3](#))

12.2.1.1 show rmon stats

Use this command to display RMON statistics measured for one or more ports.

show rmon stats [*port-string*]

Syntax Description

<i>port-string</i>	(Optional) Displays RMON statistics for specific port(s).
--------------------	---

Command Defaults

If *port-string* is not specified, RMON stats will be displayed for all ports.

Command Mode

Read-Only.

Example

This example shows how to display RMON statistics for Fast Ethernet port 1 in switch 1.

```
A2(ro)->show rmon stats fe.1.1

Port: fe.1.1
-----
Index           = 1
Owner           = monitor
Data Source     = ifIndex.1

Drop Events     = 0          Packets           = 0
Collisions      = 0          Octets           = 0
Jabbers         = 0          0 - 64 Octets   = 0
Broadcast Pkts  = 0          65 - 127 Octets = 0
Multicast Pkts  = 0          128 - 255 Octets = 0
CRC Errors      = 0          256 - 511 Octets = 0
Undersize Pkts  = 0          512 - 1023 Octets = 0
Oversize Pkts   = 0          1024 - 1518 Octets = 0
Fragments       = 0
```

[Table 12-2](#) provides an explanation of the command output.

Table 12-2 show rmon stats Output Details

Output	What It Displays...
Port	Port designation.
Owner	Name of the entity that configured this entry. Monitor is default.
Data Source	Data source of the statistics being displayed.
Drop Events	Total number of times that the switch was forced to discard frames due to lack of available switch device resources. This does not display the number of frames dropped, only the number of times the switch was forced to discard frames.
Collisions	Total number of collisions that have occurred on this interface.
Jabbers	Total number of frames that were greater than 1518 bytes and had either a bad FCS or a bad CRC.
Broadcast Pkts	Total number of good frames that were directed to the broadcast address. This value does not include multicast frames.
Multicast Pkts	Total number of good frames that were directed to the multicast address. This value does not include broadcast frames.
CRC Errors	Number of frames with bad Cyclic Redundancy Checks (CRC) received from the network. The CRC is a 4-byte field in the data frame that ensures that the data received is the same as the data that was originally sent.
Undersize Pkts	Number of frames received containing less than the minimum Ethernet frame size of 64 bytes (not including the preamble) but having a valid CRC.
Oversize Pkts	Number of frames received that exceeded 1518 data bytes (not including the preamble) but had a valid CRC.
Fragments	Number of received frames that are not the minimum number of bytes in length, or received frames that had a bad or missing Frame Check Sequence (FCS), were less than 64 bytes in length (excluding framing bits, but including FCS bytes) and had an invalid CRC. It is normal for this value to increment since fragments are a normal result of collisions in a half-duplex network.
Packets	Total number of frames (including bad frames, broadcast frames, and multicast frames) received on this interface.
Octets	Total number of octets (bytes) of data, including those in bad frames, received on this interface.
0 – 64 Octets	Total number of frames, including bad frames, received that were 64 bytes in length (excluding framing bits, but including FCS bytes).

Table 12-2 show rmon stats Output Details (Continued)

Output	What It Displays...
65 – 127 Octets	Total number of frames, including bad frames, received that were between 65 and 127 bytes in length (excluding framing bits, but including FCS bytes).
128 – 255 Octets	Total number of frames, including bad frames, received that were between 128 and 255 bytes in length (excluding framing bits, but including FCS bytes).
256 – 511 Octets	Total number of frames, including bad frames, received that were between 256 and 511 bytes in length (excluding framing bits, but including FCS bytes).
512 – 1023 Octets	Total number of frames, including bad frames, received that were between 512 and 1023 bytes in length (excluding framing bits, but including FCS bytes).
1024 – 1518 Octets	Total number of frames, including bad frames, received that were between 1024 and 1518 bytes in length (excluding framing bits, but including FCS bytes).

12.2.1.2 set rmon stats

Use this command to configure an RMON statistics entry.

set rmon stats *index port-string* [*owner*]

Syntax Description

<i>index</i>	Specifies an index for this statistics entry.
<i>port-string</i>	Specifies port(s) to which this entry will be assigned.
<i>owner</i>	(Optional) Assigns an owner for this entry.

Command Defaults

If *owner* is not specified, **monitor** will be applied.

Command Mode

Read-Write.

Example

This example shows how to configure RMON statistics entry 2 for fe.1.20:

```
A2 (rw) -> set rmon stats 2 fe.1.20
```

12.2.1.3 clear rmon stats

Use this command to delete one or more RMON statistics entries.

clear rmon stats {*index-list* | **to-defaults**}

Syntax Description

<i>index-list</i>	Specifies one or more stats entries to be deleted, causing them to disappear from any future RMON queries.
to-defaults	Resets all history entries to default values. This will cause entries to reappear in RMON queries.

Command Defaults

None.

Command Mode

Read-Write.

Example

This example shows how to delete RMON statistics entry 2:

```
A2 (rw) ->clear rmon stats 2
```

12.2.2 History Group Commands

Purpose

To display, configure, and clear RMON history properties and statistics.

Commands

- show rmon history ([Section 12.2.2.1](#))
- set rmon history ([Section 12.2.2.2](#))
- clear rmon history ([Section 12.2.2.3](#))

12.2.2.1 show rmon history

Use this command to display RMON history properties and statistics. The RMON history group records periodic statistical samples from a network.

```
show rmon history [port-string]
```

Syntax Description

<i>port-string</i>	(Optional) Displays RMON history entries for specific port(s).
--------------------	--

Command Defaults

If *port-string* is not specified, information about all RMON history entries will be displayed.

Command Mode

Read-Only.

Example

This example shows how to display RMON history entries for Fast Ethernet port 1 in switch 1. A control entry displays first, followed by actual entries corresponding to the control entry. In this case, the default settings for entry owner, sampling interval, and maximum number of entries (buckets) have not been changed from their default values. For a description of the types of statistics shown, refer to [Table 12-2](#).

```
A2(ro)->show rmon history fe.1.1
```

```
Port: fe.1.1
```

```
-----
```

```
Index 1
```

```
Owner          = monitor
```

```
Status         = valid
```

```
Data Source    = ifIndex.1
```

```
Interval       = 30
```

```
Buckets Requested = 50
```

```
Buckets Granted  = 10
```

```
Sample 2779      Interval Start: 1 days 0 hours 2 minutes 22 seconds
```

```
Drop Events      = 0      Undersize Pkts    = 0
```

```
Octets           = 0      Oversize Pkts    = 0
```

```
Packets          = 0      Fragments        = 0
```

```
Broadcast Pkts   = 0      Jabbers          = 0
```

```
Multicast Pkts   = 0      Collisions        = 0
```

```
CRC Align Errors = 0      Utilization(%)    = 0
```

12.2.2.2 set rmon history

Use this command to configure an RMON history entry.

```
set rmon history index [port-string] [buckets buckets] [interval interval] [owner owner]
```

Syntax Description

<i>index-list</i>	Specifies an index number for this entry.
<i>port-string</i>	(Optional) Assigns this entry to a specific port.
buckets <i>buckets</i>	(Optional) Specifies the maximum number of entries to maintain.
interval <i>interval</i>	(Optional) Specifies the sampling interval in seconds.
owner <i>owner</i>	(Optional) Specifies an owner for this entry.

Command Defaults

- If *buckets* is not specified, the maximum number of entries maintained will be 50.
- If not specified, *interval* will be set to 30 seconds.
- If *owner* is not specified, **monitor** will be applied.

Command Mode

Read-Write.

Example

This example shows how configure RMON history entry 1 on port fe.2.1 to sample every 20 seconds:

```
A2 (rw) ->set rmon history 1 fe.2.1 interval 20
```

12.2.2.3 clear rmon history

Use this command to delete one or more RMON history entries or reset one or more entries to default values. For specific values, refer to [Section 12.2.2.2](#).

clear rmon history {*index-list* | **to-defaults**}

Syntax Description

<i>index-list</i>	Specifies one or more history entries to be deleted, causing them to disappear from any future RMON queries.
to-defaults	Resets all history entries to default values. This will cause entries to reappear in RMON queries.

Command Defaults

None.

Command Mode

Read-Write.

Example

This example shows how to delete RMON history entry 1:

```
A2 (rw) ->clear rmon history 1
```

12.2.3 Alarm Group Commands

Purpose

To display, configure, and clear RMON alarm entries and properties.

Commands

- show rmon alarm ([Section 12.2.3.1](#))
- set rmon alarm properties ([Section 12.2.3.2](#))
- set rmon alarm status ([Section 12.2.3.3](#))
- clear rmon alarm ([Section 12.2.3.4](#))

12.2.3.1 show rmon alarm

Use this command to display RMON alarm entries. The RMON alarm group periodically takes statistical samples from RMON variables and compares them with previously configured thresholds. If the monitored variable crosses a threshold an RMON event is generated.

show rmon alarm [*index*]

Syntax Description

<i>index</i>	(Optional) Displays RMON alarm entries for a specific entry index ID.
--------------	---

Command Defaults

If *index* is not specified, information about all RMON alarm entries will be displayed.

Command Mode

Read-Only.

Example

This example shows how to display RMON alarm entry 3:

```
A2 (rw) ->show rmon alarm 3
Index 3
-----
Owner           = Manager
Status          = valid
Variable        = 1.3.6.1.4.1.5624.1.2.29.1.2.1.0
Sample Type     = delta           Startup Alarm      = rising
Interval       = 30              Value           = 0
Rising Threshold = 1             Falling Threshold = 0
Rising Event Index = 2          Falling Event Index = 0
```

Table 12-3 provides an explanation of the command output.

Table 12-3 show rmon alarm Output Details

Output	What It Displays...
Index	Index number for this alarm entry.
Owner	Text string identifying who configured this entry.

Table 12-3 show rmon alarm Output Details (Continued)

Output	What It Displays...
Status	Whether this event entry is enabled (valid) or disabled.
Variable	MIB object to be monitored.
Sample Type	Whether the monitoring method is an absolute or a delta sampling.
Startup Alarm	Whether alarm generated when this entry is first enabled is rising, falling, or either.
Interval	Interval in seconds at which RMON will conduct sample monitoring.
Rising Threshold	Minimum threshold for causing a rising alarm.
Falling Threshold	Maximum threshold for causing a falling alarm.
Rising Event Index	Index number of the RMON event to be triggered when the rising threshold is crossed.
Falling Event Index	Index number of the RMON event to be triggered when the falling threshold is crossed.

12.2.3.2 set rmon alarm properties

Use this command to configure an RMON alarm entry, or to create a new alarm entry with an unused alarm index number.

```
set rmon alarm properties index [interval interval] [object object] [type
{absolute | delta}] [startup {rising | falling | either}] [rthresh rthresh] [fthresh
fthresh] [revent revent] [fevent fevent] [owner owner]
```

Syntax Description

<i>index</i>	Specifies an index number for this entry. Maximum number or entries is 50. Maximum value is 65535 .
interval <i>interval</i>	(Optional) Specifies an interval (in seconds) for RMON to conduct sample monitoring.
object <i>object</i>	(Optional) Specifies a MIB object to be monitored. <div data-bbox="602 713 661 802" data-label="Image"> </div> NOTE: This parameter is not mandatory for executing the command, but must be specified in order to enable the alarm entry configuration.
type absolute delta	(Optional) Specifies the monitoring method as: sampling the absolute value of the object, or the difference (delta) between object samples.
startup rising falling either	(Optional) Specifies the type of alarm generated when this event is first enabled as: <ul style="list-style-type: none"> • Rising - Sends alarm when an RMON event reaches a maximum threshold condition is reached, for example, more than 30 collisions per second. • Falling - Sends alarm when RMON event falls below a minimum threshold condition, for example when the network is behaving normally again. • Either - Sends alarm when either a rising or falling threshold is reached.
rthresh <i>rthresh</i>	(Optional) Specifies a minimum threshold for causing a rising alarm.
fthresh <i>fthresh</i>	Specifies a maximum threshold for causing a falling alarm.
revent <i>revent</i>	Specifies the index number of the RMON event to be triggered when the rising threshold is crossed.

fevent <i>fevent</i>	Specifies the index number of the RMON event to be triggered when the falling threshold is crossed.
owner <i>owner</i>	(Optional) Specifies the name of the entity that configured this alarm entry.

Command Defaults

- interval - **3600** seconds
- type - **absolute**
- startup - **rising**
- rthresh - **0**
- fthresh - **0**
- revent - **0**
- fevent - **0**
- owner - **monitor**

Command Mode

Read-Write.

Example

This example shows how to configure a rising RMON alarm. This entry will conduct monitoring of the delta between samples every 30 seconds:

```
A2 (rw) ->set rmon alarm properties 3 interval 30 object
1.3.6.1.4.1.5624.1.2.29.1.2.1.0 type delta rthresh 1 revent 2 owner Manager
```

12.2.3.3 set rmon alarm status

Use this command to enable an RMON alarm entry. An alarm is a notification that a statistical sample of a monitored variable has crossed a configured threshold.

set rmon alarm status *index* enable

NOTE: An RMON alarm entry can be created using this command, configured using the **set rmon alarm properties** command ([Section 12.2.3.2](#)), then enabled using this command. An RMON alarm entry can be created and configured at the same time by specifying an unused index with the set properties command.

Syntax Description

<i>index</i>	Specifies an index number for this entry. Maximum number or entries is 50. Maximum value is 65535 .
enable	Enables this alarm entry.

Command Defaults

None.

Command Mode

Read-Write.

Example

This example shows how to enable RMON alarm entry 3:

```
A2 (rw) -> set rmon alarm status 3 enable
```

12.2.3.4 clear rmon alarm

Use this command to delete an RMON alarm entry.

clear rmon alarm *index*

Syntax Description

<i>index</i>	Specifies the index number of entry to be cleared.
--------------	--

Command Defaults

None.

Command Mode

Read-Write.

Example

This example shows how to clear RMON alarm entry 1:

```
A2 (rw) ->clear rmon alarm 1
```

12.2.4 Event Group Commands

Purpose

To display and clear RMON events, and to configure RMON event properties.

Commands

- show rmon event ([Section 12.2.4.1](#))
- set rmon event properties ([Section 12.2.4.2](#))
- set rmon event status ([Section 12.2.4.3](#))
- clear rmon event ([Section 12.2.4.4](#))

12.2.4.1 show rmon event

Use this command to display RMON event entry properties.

show rmon event [*index*]

Syntax Description

<i>index</i>	(Optional) Displays RMON properties and log entries for a specific entry index ID.
--------------	--

Command Defaults

If *index* is not specified, information about all RMON entries will be displayed.

Command Mode

Read-Only.

Example

This example shows how to display RMON event entry 3:

```

A2 (rw) ->show rmon event 3

Index 3
-----
Owner           = Manager
Status          = valid
Description     = STP Topology change
Type            = log-and-trap
Community       = public
Last Time Sent  = 0 days 0 hours 0 minutes 37 seconds
    
```

Table 12-4 provides an explanation of the command output.

Table 12-4 show rmon event Output Details

Output	What It Displays...
Index	Index number for this event entry.
Owner	Text string identifying who configured this entry.
Status	Whether this event entry is enabled (valid) or disabled.
Description	Text string description of this event.
Type	Whether the event notification will be a log entry, and SNMP trap, both, or none.

Table 12-4 show rmon event Output Details (Continued)

Output	What It Displays...
Community	SNMP community name if message type is set to trap.
Last Time Sent	When an event notification matching this entry was sent.

12.2.4.2 set rmon event properties

Use this command to configure an RMON event entry, or to create a new event entry with an unused event index number.

```

set rmon event properties index [description description] [type {none | log | trap
| both}] [community community] [owner owner]
```

Syntax Description

<i>index</i>	Specifies an index number for this entry. Maximum number of entries is 100. Maximum value is 65535 .
description <i>description</i>	(Optional) Specifies a text string description of this event.
type none log trap both	(Optional) Specifies the type of RMON event notification as: none, a log table entry, an SNMP trap, or both a log entry and a trap message.
community <i>community</i>	(Optional) Specifies an SNMP community name to use if the message type is set to trap . For details on setting SNMP traps and community names, refer to Section 4.3.8 .
owner <i>owner</i>	(Optional) Specifies the name of the entity that configured this entry.

Command Defaults

- If **description** is not specified, none will be applied.
- If not specified, **type none** will be applied.
- If *owner* is not specified, **monitor** will be applied.

Command Mode

Read-Write.

Example

This example shows how to create and enable an RMON event entry called “STP topology change” that will send both a log entry and an SNMP trap message to the “public” community:

```

A2 (rw) ->set rmon event properties 2 description "STP topology change" type both
community public owner Manager
```

12.2.4.3 set rmon event status

Use this command to enable an RMON event entry. An event entry describes the parameters of an RMON event that can be triggered. Events can be fired by RMON alarms and can be configured to create a log entry, generate a trap, or both.

set rmon event status *index* enable

NOTE: An RMON event entry can be created using this command, configured using the **set rmon event properties** command ([Section 12.2.4.2](#)), then enabled using this command. An RMON event entry can be created and configured at the same time by specifying an unused index with the set properties command.

Syntax Description

<i>index</i>	Specifies an index number for this entry. Maximum number of entries is 100. Maximum value is 65535 .
enable	Enables this event entry.

Command Defaults

None.

Command Mode

Read-Write.

Example

This example shows how to enable RMON event entry 1:

```
A2 (rw) -> set rmon event status 1 enable
```

12.2.4.4 clear rmon event

Use this command to delete an RMON event entry and any associated log entries.

clear rmon event *index*

Syntax Description

<i>index</i>	Specifies the index number of the entry to be cleared.
--------------	--

Command Defaults

None.

Command Mode

Read-Write.

Example

This example shows how to clear RMON event 1:

```
A2 (rw) ->clear rmon event 1
```

12.2.5 Filter Group Commands

The packet capture and filter function is disabled by default. When it is enabled, the SecureStack A2 switch will capture 100 frames as close to sequentially as possible. These 100 frames will be placed into a buffer for inspection. If there is data in the buffer when the function is started, the buffer will be overwritten. Once 100 frames have been captured, the capture will stop. Filtering will be performed on the frames captured in the buffer.

NOTE: Packet capture filter is sampling only and does not guarantee receipt of back to back packets.

One channel at a time can be supported, with up to three filters. Configured channel, filter, and buffer control information will be saved across resets, but captured frames will not.

This function cannot be used concurrently with port mirroring. The system will check to prevent concurrently enabling both functions, and a warning will be generated in the CLI if attempted.

Commands

- show rmon channel ([Section 12.2.5.1](#))
- set rmon channel ([Section 12.2.5.2](#))
- clear rmon channel ([Section 12.2.5.3](#))
- show rmon filter ([Section 12.2.5.4](#))
- set rmon filter ([Section 12.2.5.5](#))
- clear rmon filter ([Section 12.2.5.6](#))

12.2.5.1 show rmon channel

Use this command to display RMON channel entries for one or more ports.

```
show rmon channel [port-string]
```

Syntax Description

<i>port-string</i>	(Optional) Displays RMON channel entries for a specific port(s).
--------------------	--

Command Defaults

If *port-string* is not specified, information about all channels will be displayed.

Command Mode

Read-Only.

Example

This example shows how to display RMON channel information for fe.2.12:

```
A2 (rw) ->show rmon channel fe.2.12
Port fe.2.12      Channel index= 628      EntryStatus= valid
-----
Control           off           AcceptType           matched
OnEventIndex      0           OffEventIndex        0
EventIndex        0           Status               ready
Matches           4498
Description        Thu Dec 16 12:57:32 EST 2004
Owner             NetSight smith
```

12.2.5.2 set rmon channel

Use this command to configure an RMON channel entry.

```
set rmon channel index port-string [accept {matched | failed}] [control {on | off}] [description description] [owner owner]
```

Syntax Description

<i>index</i>	Specifies an index number for this entry. An entry will automatically be created if an unused index number is chosen. Maximum number of entries is 2. Maximum value is 65535 .
<i>port-string</i>	Specifies the port on which traffic will be monitored.
accept matched failed	(Optional) Specifies the action of the filters on this channel as: <ul style="list-style-type: none">• matched - Packets will be accepted on filter matches• failed - Packets will be accepted if they fail a match
control on off	(Optional) Enables or disables control of the flow of data through the channel.
description <i>description</i>	(Optional) Specifies a description for this channel.
owner <i>owner</i>	(Optional) Specifies the name of the entity that configured this entry.

Command Defaults

- If an **action** is not specified, packets will be accepted on filter matches.
- If not specified, **control** will be set to **off**.
- If a **description** is not specified, none will be applied.
- If **owner** is not specified, it will be set to **monitor**.

Command Mode

Read-Write.

Example

This example shows how to create an RMON channel entry:

```
A2 (rw) -> set rmon channel 54313 fe.2.12 accept failed control on description  
"capture all"
```

12.2.5.3 clear rmon channel

Use this command to clear an RMON channel entry.

clear rmon channel *index*

Syntax Description

<i>index</i>	Specifies the channel entry to be cleared.
--------------	--

Command Defaults

None.

Command Mode

Read-Write.

Example

This example shows how to clear RMON channel entry 2:

```
A2 (rw) ->clear rmon channel 2
```

12.2.5.4 show rmon filter

Use this command to display one or more RMON filter entries.

```

show rmon filter [index index | channel channel]

```

Syntax Description

index <i>index</i>	(Optional) Displays information about a specific filter entry,
channel <i>channel</i>	or about all filters which belong to a specific channel.

Command Defaults

If no options are specified, information for all filter entries will be displayed.

Command Mode

Read-Only.

Example

This example shows how to display all RMON filter entries and channel information:

```

A2 (rw) ->show rmon filter

Index= 55508      Channel Index= 628      EntryStatus= valid
-----
Data Offset      0          PktStatus      0
PktStatusMask    0          PktStatusNotMask 0
Owner            ETS,NAC-D
-----
Data
ff ff ff ff ff ff
-----
DataMask
ff ff ff ff ff ff
-----
DataNotMask
00 00 00 00 00 00
    
```

12.2.5.5 set rmon filter

Use this command to configure an RMON filter entry.

```
set rmon filter index channel_index [offset offset] [status status] [smask smask]
[snotmask snotmask] [data data] [dmask dmask] [dnotmask dnotmask] [owner
owner]
```

Syntax Description

<i>index</i>	Specifies an index number for this entry. An entry will automatically be created if an unused index number is chosen. Maximum number of entries is 10. Maximum value is 65535 .
<i>channel_index</i>	Specifies the channel to which this filter will be applied.
offset <i>offset</i>	(Optional) Specifies an offset from the beginning of the packet to look for matches.
status <i>status</i>	(Optional) Specifies packet status bits that are to be matched.
smask <i>smask</i>	(Optional) Specifies the mask applied to status to indicate which bits are significant.
snotmask <i>snotmask</i>	(Optional) Specifies the inversion mask that indicates which bits should be set or not set
data <i>data</i>	(Optional) Specifies the data to be matched.
dmask <i>dmask</i>	(Optional) Specifies the mask applied to data to indicate which bits are significant.
dnotmask <i>dnotmask</i>	(Optional) Specifies the inversion mask that indicates which bits should be set or not set.
<i>owner</i>	(Optional) Specifies the name of the entity that configured this entry.

Command Defaults

- If *owner* is not specified, it will be set to **monitor**.
- If no other options are specified, none (0) will be applied.

Command Mode

Read-Write.

Example

This example shows how to create RMON filter 1 and apply it to channel 9:

```
A2 (rw) -> set rmon filter 1 9 offset 30 data 0a154305 dmask ffffffff
```

12.2.5.6 clear rmon filter

Use this command to clear an RMON filter entry.

clear rmon filter {**index** *index* | **channel** *channel*}

Syntax Description

index <i>index</i> channel <i>channel</i>	Clears a specific filter entry, or all entries belonging to a specific channel.
--	---

Command Defaults

None.

Command Mode

Read-Write.

Example

This example shows how to clear RMON filter entry 1:

```
A2 (rw) ->clear rmon filter index 1
```

12.2.6 Packet Capture Commands

Note that packet capture filter is sampling only and does not guarantee receipt of back to back packets.

Purpose

To display RMON capture entries, configure, enable, or disable capture entries, and clear capture entries.

Commands

- show rmon capture ([Section 12.2.6.1](#))
- set rmon capture ([Section 12.2.6.2](#))
- clear rmon capture ([Section 12.2.6.3](#))

12.2.6.1 show rmon capture

Use this command to display RMON capture entries and associated buffer control entries.

show rmon capture [*index* [**nodata**]]

Syntax Description

<i>index</i>	(Optional) Displays the specified buffer control entry and all captured packets associated with that entry.
nodata	(Optional) Displays only the buffer control entry specified by index.

Command Defaults

If no options are specified, all buffer control entries and associated captured packets will be displayed.

Command Mode

Read-Only.

Example

This example shows how to display RMON capture entries and associated buffer entries:

```
A2(rw)->show rmon capture
Buf.control= 28062  Channel= 38283      EntryStatus= valid
-----
FullStatus          avail      FullAction          lock
Captured packets   251        Capture slice      1518
Download size       100        Download offset    0
Max Octet Requested 50000      Max Octet Granted  50000
Start time          1 days 0 hours 51 minutes 15 seconds
Owner               monitor

captureEntry= 1      Buff.control= 28062
-----
Pkt ID             9          Pkt time          1 days 0 hours 51 minutes 15 seconds
Pkt Length         93          Pkt status        0
Data:
00 00 5e 00 01 01 00 01 f4 00 7d ce 08 00 45 00
00 4b b4 b9 00 00 40 11 32 5c 0a 15 43 05 86 8d
bf e5 00 a1 0e 2b 00 37 cf ca 30 2d 02 01 00 04
06 70 75 62 6c 69 63 a2 20 02 02 0c 92 02 01 00
02 01 00 30 14 30 12 06 0d 2b 06 01 02 01 10 07
01 01 0b 81 fd 1c 02 01 01 00 11 0b 00
```

12.2.6.2 set rmon capture

Use this command to configure an RMON capture entry.

```
set rmon capture index [channel [action {lock}] [slice slice] [loadsize loadsize] [offset offset] [asksize asksize] [owner owner]
```

Syntax Description

<i>index</i>	Specifies a buffer control entry.
<i>channel</i>	Specifies the channel to which this capture entry will be applied.
action lock	(Optional) Specifies the action of the buffer when it is full as: <ul style="list-style-type: none"> lock - Packets will cease to be accepted
slice <i>slice</i>	(Optional) Specifies the maximum octets from each packet to be saved in a buffer. (default: 1518)
loadsize <i>loadsize</i>	(Optional) Specifies the maximum octets from each packet to be downloaded from the buffer (default: 100)
offset <i>offset</i>	(Optional) Specifies that the first octet from each packet that will be retrieved.
asksize <i>asksize</i>	(Optional) Specifies the requested maximum octets to be saved in this buffer.
<i>owner</i>	(Optional) Specifies the name of the entity that configured this entry.

Command Defaults

- If not specified, **action** defaults to **lock**.
- If not specified, **offset** defaults to **0**.
- If not specified, **asksize** defaults to **1** (which will request as many octets as possible)
- If **slice** is not specified, **1518** will be applied.
- If **loadsize** is not specified, **100** will be applied.
- If **owner** is not specified, it will be set to **monitor**.

Command Mode

Read-Write.

Example

This example shows how to create RMON capture entry 1 to “listen” on channel 628:

```
A2 (rw) -> set rmon capture 1 628
```

12.2.6.3 clear rmon capture

Use this command to clears an RMON capture entry.

clear rmon capture *index*

Syntax Description

<i>index</i>	Specifies the capture entry to be cleared.
--------------	--

Command Defaults

None.

Command Mode

Read-Write.

Example

This example shows how to clear RMON capture entry 1:

```
A2 (rw) ->clear rmon capture 1
```

Scrolling screens 2-16

Secure Shell (SSH) 10-80

- enabling 10-82
- regenerating new keys 10-83

Security

- methods, overview of 10-1

Serial Port

- downloading upgrades via 2-87

set diffserv adminmode 7-2

set switch stack-port 2-25

show system utilization cpu 2-56

SNMP

- access rights 4-23
- accessing in router mode 4-3
- enabling on the switch 4-27
- MIB views 4-30
- notification parameters 4-48
- notify filters 4-53
- security models and levels 4-2
- statistics 4-5
- target addresses 4-42
- target parameters 4-36
- trap configuration example 4-60
- users, groups and communities 4-11

SNTP 11-27

Spanning Tree 5-1

- backup root 5-36, 5-37
- bridge parameters 5-3
- features 5-2
- port parameters 5-54

Rapid Spanning Tree Protocol (RSTP) 5-1

SSL WebView 2-10

Stacking

- configuring switches in a stack 2-19
- installing units 2-20

Syslog 11-2
